A further comment about Forth; some it's concepts have been incorporated into commercial software and even printer ROMs. PostScript uses a Forth model, for instance. A PC-based laboratory data capture and manipulation program called Assyst uses a Forth model (RPN and a stack) as well; so does the CyberMate animation system on the ST. The time I spent learning Forth was not wasted...

Speaking of --POSTFIX-- versus --INFIX-- notation for the FORTH language... if people didn't like dealing with --POSTFIX-- notation, then surely someone must have written an expression parser that accepted INFIX notation? It would seem like a natural thing to do right from the start. I mean... I have seen examples written in PASCAL, and the PASCAL parser didn't really need any tweaking. While it is true that using an INFIX parser sort of defeats the purpose of FORTH, i.e. saving on speed and space by conforming to the machine's architecture, wouldn't it have helped FORTH gain wider acceptance? (Well, all right, maybe not a parser, but how about maybe a --POSTFIX-- to --INFIX-- "translator" A LA the BASIC "tokenizer".)

3. 8" disk drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-01 07:47:26 UTC
From: bbs@neb
Message-ID: <1993Jan1.074726.3972@neb>
Source record: 108415

I've recently come into contact with numerous IBM style (old mainframe/teletype) 8" disk drive mechanisms (dual drive cases). Are these usable with the ATR8000 (or MIO)? If so, what software would/could be used to format out those monster disks? I've noticed that the disks themselves are notated as: Double sided, double density. Does that indicate 360k of storage? I've heard rumors of 1.2meg 8" disks/drives.

Any information on this project GREATLY appeciated.

I used to work on a CP/M system with 8" drives. As I recall, they had
1024 1K sectors, for 1 megabyte of storage. I also vaguely recall the
ATR8000 as being advertised to work with 8" drives, but I have no personal
experience with it.

BTW: I meant LEFT margin! I'll see how many byte the current pot
routine takes now
Could be put there or maybe some where in the stack area. There's other
stuff you could do, like monitor the consol keys, steal the disk vectors.
At one time I'd written a routine that would replace the DSKINV & SIOV
vectors with user written ones in ram where the international character
set goes. Bob Wooley had speculated that Flight Simulator was bugging
out when the XF551 was switching to double density during the software
protection test. I was going to have it switch to single after every
call to DSKINV. After I got it running I never bothered to pick up
a copy of FS to check it out <g>.

I've had a few 8" disk drives attached to a ATR-8000, but I can't give you any info on the MIO. A single sided drive will yield over 500KB, and a DS/DD one will yield over 1MB. They are formated to 77 tracks, thus you should use MyDos (or one of a few other DOSs that support this configuration). You can format the drive (if you wanted to) to be compatible with DOS 2.0, but you would be stuck with 90K. I prefer MyDos because of sub-directories, as you can easily get to many files in a single directory when you have over 500KB.

There are, however, some things to note: You will need a power supply, one that will go to 24V. (There are other voltages needed also, but this one is the hardest to find). Some 8" drives also require 120VAC to power the main motor. The next thing to note is that the 8" drives use a 50 pin cable, where as the controler provides you with a 34 pin, thus you will need an adapter. I bought mine from SWP (the manufactures of the ATR-8000) for about $15 and modified it to support multiple drives. The last thing to note is the Head Selects. There are some jumpers on your 8" drives that say when to select the heads. If for some reason the heads on both drives get selected simontaniously (sp?), your power supply will turn to smoke (unless it's a good one). I had a good one, but every time the heads kicked in, my lights would dim around the house.

Nowdays, I use a pair of 3 1/2" DS/DD drives on my ATR-8000 with a 1050 as the boot drive. My Shugarts (and the power supply) are in a storage shed, and I visit them regularly for nastalgic reasons. The point is that I would rather loose a few hundred K per disk if I don't have to get a hernia lugging the drives around. 720K 3 1/2" drives go for about $50, and you don't need any strange adapters or power supplys. Also, you can find 3 1/2" disks at the local supermarket vs. a military surplus store.

All the information you would need to hook up any type of drive to the ATR-8000 is included in the manual. I don't know if SWP is still around, so I don't know if you can still get the adapter, but making your own wouldn't be too hard. There is a good description of how to do this in a very old issue of "Micro Cornocopia", or you could rough it out with your local computer science library (just find the pinouts of both types of drives, and play connect the dots). Finding the power supply is a little more difficult nowdays, you might want to

see if you can grab the supply that was used to run the drives initially (the place where you got the drives).

>Is there a version of the UNIX "as6502" cross-assembler utility that even
>--SUPPORTS-- a "v" flag ? What assembler was used to generate object code
>from these sources, does anyone know ? Thank you.

.SBTTL means "Subtitle," and just makes an informative title appear
at the (usually) second line of each page in the assembly listing created
as a result of assembling the code.

<byte>!<byte> usually means "bitwise OR" of two bytes, i.e. "a quan-
tity in which all bits are set which were set in EITHER of the two original
bytes." Example: 2!4 = 6

I don't know about the -v flag or what assembler was used to build
Kermit-65. John Dunning, who last I heard was at least still marginally
associated with this newsgroup in the capacity of manager of new 8-bit
contributions to the Atari Archive, did the port of Kermit-65 from the
Commodore 64, producing the KERMIT.EXE that is in common use today. I'd
say John would be the guy to ask about this. John, are you still out there?
(If you're still unable to post, e-mail me and I'll relay to the newsgroup,
John...)

"Just when you thought it was safe to go back in the water...."

Well, the KERMIT-65 saga continues. I was able to locate a 6502 cross-assembler written in C. It is able to generate an ASCII text assembler listing, both with program source, or just with assembled byte values given in ASCII text. This program is able to run on a "Kernighan and Ritchie" C compiler. Unfortunately, the program that accompanies the assembler, that is supposed to turn the text characters into binary code, is written in ANSI C, and the file calls make the K&R C compiler I am using do strange things. <* ARG! *> Why can't this assembler generate UUENCODE output as an option? Why do people --DO-- things like this? Why do they add non-compatible ANSI C programs to programs that are K&R C compliant? This is driving me crazy!

BS> do you happen to know if the mio will run an 8" drive?

The MIO doesn't have any direct support for drive mechanisms. However if you can somehow come up with a generic SCSI controller for the drive, you should be able to run it through the MIO's SCSI port.

The bigger question (other than you probally already have an 8" drive) is why you would *want* to use an 8" drive on your Atari? They are larger and have less capacity than a 5.25 or 3.5 drive, not to mention harder to find replacement parts for.

>conference, what can you tell me about it? (Where to get it, etc.)

That is a very good question!!!

I am happy to tell you, that QUICK will be available soon including an
english manual.

What is QUICK - in short:

QUICK is a completely software-based compiler language that is almost
as fast as assembler and also almost as easy to use as BASIC.

QUICK comes with some unique features like:
- Build-in Mouse-routines (for ST mouse)
- " player-missile commands
- " routines for playing digitized sounds
- " routines to move and copy high-res graphics
- Automatic use of VBI and DLI!
- Subroutines, local variables, INLINE mc-code
- Libraries

As I'm one of the programmers of QUICK, I can answer to any other
questions you have. There will be an announce, as soon as the english
version in ready.

There are some different places to get QUICK - as soon as the english
version is ready. At the moment you can get the german version from:

PPP
Postfach 1640
7518 Bretten
Germany

I am very interested in obtaining such a cross-assembler, where did you get it?
Is it commercial (I assume not, because you've got source) or PD? It really
shouldn't be that hard to get it to write out in any format you want.

I am primarily interested in running it under Unix and converting it to write
Atari executables directly. The reason is that I kind of like having access
to my hard drive, 80 columns, and a fast CPU. I do have a ANSI compiler, but
I am really interested in the assembler itself.

If you could put it on BART or mail it to me (assuming it is PD), I would
greatly appreciate it.

PS: The reason I am posting this message instead of sending mail is that for
some reason my mailer software didn't send correctly. It seems to work OK
most of the time, however.

Source record: 108430

Well, I've figured out how to pass parameters between programs! YAY!
What are you going on about? you ask?? Well, I've been convinced to add
parameter passing abilities to the MyNI_DOS CLI. A fellow C.S.A.8 reader
(damn, sorry! I forgot who you werw! :-( ) said that SpartaDOS uses page
4 of memory, so I finally got off my duff and looked it up in _Mapping_.
Unfortunatley, the only thing on page 4 is the descriptions of addresses
8 through 11.

Ok, it was a bad joke the first time what's-his-name said it, and it
still is now :) ...

Anyways... page 4 of memory is... (drum roll, please), the CASBUF
(cassette buffer), which is only used (guess when!?) when using a program
recorder. (Oh, and also during boot...) Soooooooo . . .
I've made a TurboBASIC XL demo that shows how it's done. I'm lucky
enough now to have a RAMDisk, so running "COMmand" (.COM) files from disk
wasn't a discouraging thought. Anyways, I made a few little TBXL
programs...
COM_RUN.TBS - COMmand file RUNner (in TurboBaSic). It's a VERY simple
CLI. All it can do is load another TBXL program
(passing parameters to it), display a title/info., and
exit back to TurboBASIC.
DIRCOM.TBS - The "DIR" command. It shows a directory... the mask of
which is sent as... a PARAMETER!!...
WDIRCOM.TBS - A wide-directory (two columns) viewer.
VIEWCOM.TBS - A graphics 8, 9, and 15 picture viewer. It uses one or
two parameters!
RUNCOM.TBS - A program runner! HA!
and then, some other ones I made later that day (after I made the first
ARC and uploaded it here & there) were:
TIMECOM.TBS - sets or displays current value of TBXL's TIME$ clock.
READCOM.TBS - ..the most "complex" of the COMmand programs I've made
for this little demonstration. It displays text files,
and knows how to translate ASCII CR/LFs into AtASCII
EOLs, and it can set address 766 to 1 (meaning the
editor characters are displayed, rather than "done"),
and finally it can use the INPUT command rather than
GET to load and display AtASCII files (as long as no
line in the file is greater than 255(?) bytes...).
THIS COMmand file uses up to 4 parameters, the first
being the file name, and the other three being the
display/load settings (described above) >IN ANY ORDER!<

Cool, eh? (well, >I< think it is, as I'm not a SpartaDOS user, and I've
never done anything as way-cool as this! ;))

Well... I could simply UUEncode the ARC and post it here (perish the thought! Too bad it's a VERY small ARC, eh!? I could probably even post a LISTing of the other two COMmand files...)

BTW: Just FYI, this concept is going to be used in MyNI_DOS, and if someone'd be kind enough to explain EXACTLY how SpartaDOS does it, I could even try & make it SD compatible! gasp...

Thanx!

BYE!

From: winston@merk.com
Message-ID: <C09xHJ.Cxr@merk.com>
Source record: 108431

Where did I get a 6502 cross-assembler? This is supposed to be a secret?

o I noticed that the KERMIT-65 sources on the ATARI archive contained a reference in its "make" file to "as6502".

o I performed an "archie" on the text string "as6502".

o ARCHIE told me that a file called "as6502" lived on the node: "ftp.germany.eu.net" in the directory: "/pub/programming/languages".

o I did an FTP "get" of the file "/pub/programming/languages/as6502".

I just more or less assumed that "as6502" is needed to assemble KERMIT-65, since that is what is listed in the KERMIT-65 "make" file. Perhaps the Sysop of the Atari Archive can incorporate it into the archives, since people who downloaded KERMIT-65 will also be looking for "as6502". This way it would be file requestable via BART (provided that it is releasable, and assuming it is the same "as6502" as is mentioned in the "make" file).

22. Re: My ego VS UUE

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-03 19:02:53 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <72812@cup.portal.com>
Source record: 108433

I have a clone sitting next to my 8-bit so I just null modem to the
clone ususally to do the translation & either tranfer from the clone or
move a 3.5" disk to the ST. If I use my 8-bit for the U/L I ususally
just load the files into a word processor & print to a disk file vs P:.
I don't know what your node's like, but Portal editor is page orientated
so the only way I can get files up from disk is Xmodem => the thing
has to already be converted to ASCII.
BTW: Could you try & decode the files? I'd like one more check before
I continue.

23. WANTED: Atari 8 bit interface.

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-04 09:07:52 UTC

Cross-posted to: misc.forsale.computers.other,comp.sys.atari.8bit

I'm looking for either a parallel printer interface or a functional 850
interface unit for the Atari 8 bit line of computers. I'd like to buy
one used via the net but if any one has any names of suppliers who sell
new and used Atari 8 bit hardware, I'd like to know that info also!

Please send offers/info via e-mail.

XLEnt Software is still marketing their word processor, The First XLEnt Word Processor. Antic stated that this was the best word processor for the Atari 8 bit in 1987. The product is very fully featured. It has the ability to integrate graphics and text. It has an 80 col. preview mode. The product has very flexible editing commands. I don't know the current price but I believe it is around $20.

XLEnt Software's number is (703) 451-5017.

25. Scott Peterson XE upgrade Fix

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-04 21:14:52 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1993Jan4.211452.27290@news.ysu.edu>
Source record: 108437

I have a 320k XE w/ the Scott Peterson upgrade... a few others
here have it also. Ever since I installed it I can't run certain
programs that access the antic chip in a certain way like the Atari
Writer cart and a few more programs.
When a read the docs to Ed Bachman's WEDGE2.1 program I discovered the
answer and easy fix to this problem.
Here is the text file that tells of the problem and the fix:

```
----------------------------
** Peterson XE Upgrade Errata **
(Getting the ANTIC to see your extra ram.)

E.Bachman 1990.

=========================================================================

** Should I be reading this?? **

If you are using a stock 130XE or a Rambo'ed 800XL you have no
need to read any further, (other than for informational purposes).
Also, CSS modified XE's are built in accordance with the modification
listed below. This text concerns you if you are using an XE of
greater than 128k, OR (more specifically), if the Wedge's FORMAT
command results in an apparent system crash.

Onward..

In the process of developing the current revision of the Wedge, I
stumbled across an interesting bit of information. It seems that the
320k Peterson XE upgrades don't allow for the ANTIC chip to access
extended ram. Anyone familiar with this upgrade knows that the antic
enable pin of the PIA chip gets lifted from the motherboard to
provide for the extended addressing needed to access the extra ram.
Thus leaving the ANTIC's extended bank addressing capability
untapped. This can be overcome by tying the antic and cpu's enable
lines together (much the same way as it's done in the rambo'ed XL's).
Correcting this is simplicity itself, simply tie pins 14 and 15 of
the socket for the PIA, together, (you know, that socket that you
hopefully installed when you did your upgrade?), If not, simply run a
short jumper from the pad on the motherboard that pin 15 used to
occupy, to pin 14 on the same chip, (the PIA).

NOTE: From the docs I've seen, the larger Peterson XE upgrades look
as if they also neglect the antic enable line. This minor mod should
work just as well on them as it has on the 320k XE's.

** So what does this mean to me? **
```

Well hopefully you're reading this before you've run the wedge
and found out that the format command bombs out in a major way. Why?
because the format command uses a custom screen and display list, run
out of the extended ram. Thus ANTIC, being unable to access extended
ram will attempt to generate a screen from whatever data is in the
main bank at those particular locations. The resultant display will
usually be a blank screen, or some unreadable garbage. To address
this, I've included a specially written format program,
"P_FORMAT.COM". In order to demonstrate the format function to those
whose machines are unable to use the Wedge's internal format command.
AND, to hopefully coerce you to perform this simple mod to your XE.

I realize, it is not normally the place of the software developer
to tell users, "well, just modify your machine to use my software".
However I feel most strongly, that this feature will enhance the use
of your expanded XE, as well as make it compatible with future
programs that may use the extended antic access. As well as with the
Wedge and future Wedge Disk Accessories.

In closing I wish to thank Scott Peterson for his series of XE
upgrades and in no way intend for this text to berate his fine work
on the Atari 8-bit.
Ed Bachman 1-3-90.

Jonathan,

Well, it's not as simple as playing connect the dots between the SIO port connector's pins and the pins on a DB25 connector on the back of your modem. You need some sort of interface or cable that converts the signals your Atari uses, into the signals the Modem uses, which adhere to a standard called RS232.

There are several devices that can do this, none that I've seen are do it-your self kits... yet. They are all commercial products. Here is a low down on most of the ones I am aware of, and what exactly they provide:

P:R: Connection, a little box that plugs into your SIO port, and gives you two RS232 (modem) ports, and a printer port.
This device was put out by ICD, Inc, but they no longer have them in stock. best to check with one of the Mail Order houses.

850 Interface, this one from Atari, it gave one printer and 4 RS232 ports. Same as above, check with mail order houses supporting the 8 bit.

Supra R-Verter--- a cable that plugs into the SIO port, and was a cable with a modem port on the other end. Same as above, look for a used one somewhere. this will be the least expensive of them all.

MIO - a box FROM ICD Inc, that plugs into the Parallel Bus connector on the back of your 800XL, giving you Printer and Modem ports, and a SCSI/SASI hard drive connector. in addition, the box has RAM memory inside, which can be used as a print spooler and/or a RAMDISK.
The box cost from $150-$300 depending on the RAM configuration.
I think ICD might have one left... maybe not.

Black BOX - from Computer Software Services...Plugs into the Parallel Bus port like the MIO, and has Modem, Printer, and SCSI Hard disk ports. Also has some extra goodies, like a 6502 debugger, Screen dump utility, and an add on card that allows connection of IBM type

floppy drives, either 5.25" or 3.5", from 360K on up to 1.44 meg.
The plane jane Black Box runs $199.95 I think, with enhanced
printer dump routine, disk sector editor being one add-on extra, and
the Floppy Controller being another extra. This one is still being
sold, and continually supported, with frequent improvements to the
product.

Hope this helps.

Huh? WHAT "round-type modem jack on back of 800xl?" The only "round" jacks
on the back of any 800XL -I'VE- ever seen, are the power input socket and the
composite-video (monitor) socket. Which of the following is true?
a) you misspoke
b) you're confused
c) you're using an 800XL modified in some means I've never previously heard
d) you're not using an 800XL but something else entirely (see (a) and (b)).

> Is 'the' ftp site the one at archive.umich ?

Yes. Other sites may happen to have an Atari program or two, but 'the'
FTP site almost certainly means the umich.edu archive.

31. 8-bit Atari Frequently-Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-05 02:42:17 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1iasi9INN6ba@usenet.INS.CWRU.Edu>
Source record: 108443

I haven't worked on this recently, but I figured I better post it..

The 8-bit Atari
Frequently-Asked Questions List
for Usenet/Internet

Posted on or about the first of the month, simultaneously to:

comp.sys.atari.8bit and the Info-Atari8 Digest
------------------ ------------------
(the Usenet newsgroup) (the Internet mail-list)

which are, in fact, one and the same group.

Revised 17-Nov-92

additions/corrections/comments to Michael Current (currentm@carleton.edu)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the Usenet newsgroup dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All postings to comp.sys.atari.8bit automatically appear in the
Internet's Info-Atari8 Digest.
Users of Atari TT, STe, or ST computers refer to comp.sys.atari.st.
Users of Atari Portfolio computers refer to comp.sys.palmtops.
Users of Atari Lynx, 7800, 2600, or 5200 game systems see rec.games.video.

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the Internet mail-list dedicated to the free
exchange of information pertaining to the 8-bit 800/XL/XE series of Atari
computers. All contributions to the Info-Atari8 Digest automatically appear
on Usenet's comp.sys.atari.8bit.
To subscribe or unsubscribe to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To contribute to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@ucbvax.berkeley.edu.
Please note: there is NEVER a good reason to send anything to the address
Info-Atari8@naucse.cse.nau.edu.

What is the atari.archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. The 8-bit Atari Archive Moderator is John Dunning,
jrd@atari.archive.umich.edu.

How do I download files from the archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu

(141.211.182.23 or 141.211.165.41), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

help
send 8bit/-read-.-me-
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This can be useful for UUCP and other addresses that BART may not be able to figure out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other files of interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.182.23 or 141.211.165.41), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/New". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should only be posted to the discussion group as a last resort.

What is Z*Magazine?
Z*Magazine ("Z*Mag") is the International Atari 8-Bit Magazine, published monthly. It covers the 8-bit Atari computers exclusively.
To have Z*Mag delivered "right to your own mail box," send a message to Ryan 'Gozar' Collins at rlcollins@miavx1.acs.muohio.edu, asking him to add

your address to his Z*Magazine Distribution List. Back issues of Z*Mag are available at the atari.archive in the /atari/8bit/Zmag directory, in filenames such as zmag204.arc.
To reach the publishers of Z*Magazine, contact Ron Kovacs at 75300.1642@compuserve.com, or Jon Clarke at jonc@status.gen.nz.

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network.
The Atari SIG carries Z*Magazine and the Info-Atari8 Digest, as well as many product reviews and all sorts of other information related to Atari products, all online. Its mission for 8-bit users is as a depository for any and all information in ASCII format related to the 8-bit Atari computers. Send correspondence and press releases to xx004@po.cwru.edu.

What magazines support the 8-bit Atari?

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.

820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.

32. Looking for Robotron 2084...

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-05 02:50:14 UTC
From: hemstree@lamar.acns.colostate.edu
Message-ID: <HEMSTREE.93Jan4215014@lamar.lamar.acns.colostate.edu>
Source record: 108445

Sorry if this isn't the best place to post this...

I used to have an Atari 400 that had a plug-in cartridge for Robotron 2084. I am interested in creating a shareware version of this game but barely remember how it played? Does anyone know if this already exists in software? Does anyone know where I can get an Atari 400 and the Robotron 2084 cartridge?

Any help is appreciated,

Charles

33. Posting from the Internet: We have a problem

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-05 02:52:44 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1iat5sINN6qv@usenet.INS.CWRU.Edu>
Source record: 108444

I usually posted the FAQ List by mailing to
comp-sys-atari-8bit@ucbvax.berkeley.edu, the way those on the IA8 Digest
have had to do it, just because I found it more convenient. However, my
attempted postings had bounced the last two months, so I e-mailed
postmaster@ucbvax.berkeley.edu to see what I could learn. I received this:

>There are very few mail address for news groups any longer.....Here is the
>standard reply as to why.
>
>ucbvax does have some selected news groups set up for posting to via mail.
>This is intended for local use and not as a General Service...
>We don't have the facilities in either Disk Space or CPU power to provide
>this as a public service. Please post news through you own local news
>server.

This effectly means that subscribers of the Info-Atari8 Digest, who do not
have Usenet access, are presently unable to participate in this discussion
group.

We to either a) Find another address that functions the way
comp-sys-atari-8bit@ucbvax.berkeley.edu used to, or b) Get that Digest
software to automatically cross-post to Usenet, like it should have been
doing all along.

Does anyone have any suggestions? Remember that it's John Dunning,
jrd@stony-brook.scrc.symbolics.com that maintains the Digestifier.

34. Re: FORTH-83 for Atari 8-bit; anyone interested?

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-05 04:55:07 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993Jan5.045507.22247@csi.uottawa.ca>
Source record: 108446

It is most certainly possible to create an infix parser for FORTH; in the days when BYTE Magazine occasionally covered the competition between Atari, Amiga and Apple for the pre-eminent 68000-based computer (interesting... All three names start with an "A"), there was actually a column by Dick Pountain that typically presented FORTH stuff.

One issue presented an infix converter for mathematical expressions. I seem to remember the "total converter" weighing in at under 1 screen of code.

The problem is that what you REALLY want is to be able to arbitrarily move between POST and IN-FIX entry of information.

It's easy to make a parser that will read in NUMBERS, and perform operations using the operators (,), +, -, *, /. It's probably nearly trivial to extend this to allow the use of CONSTANT values, and perhaps the "IMMEDIATE VARIABLES" that are often called QUANS.

To extend it to regular variables (for which you'd get the value by: MYVARIABLE @) is extremely nontrivial.

If you want to get more information, you might want to head over to the newsgroup Comp.lang.forth.

The MIO does not interface to floppy drives, only hard drives.
(and, of course, printers and modems.)

"The saga of 'makebinary.c'...."

Well, I had been trying to compile the program "makebin.c" so that the executible could turn the hexadecimal text from the 6502 cross-assembler "as6502" into actual hexadecimal code (also known as binary executible). At first I thought that the problem was that the program was written in ANSI C, so I edited all of the file calls and subroutine header statements to be K&R compliant. Nothing happened. After toying with it for a while, convinced that I didn't understand how ANSI C properly worked, I finally fell back on the classic desperation move of putting a print statement (well, in this case a PRINTF statement) in place where anything significant happens: before subroutine calls, at the top of procedures, around calculations -- before and after, etc. I then compiled again and watched the execution trace. It was at this point that I suddenly came to the realization that the reason the program didn't --DO-- anything was not because the file calls were wrong, but because --THAT WAS THE WAY THE PROGRAM WAS WRITTEN-- !?!! The program read in the input file, but generated no output because --NO OUTPUT PROCEDURES ARE CALLED-- ! Apparently, the programmer abandoned work on the program when only half-way through writing it (but posted it to an FTP archive? I had always assumed that only --WORKING-- programs existed in FTP directories, but perhaps no one ever bothered to complain... since it was supposed to be creating executibles for the ATARI 6502 8-BIT).

This leads me to the situation I am in now. I can generate a hexadecimal text assembly listing, but what is the best or most accepted method for generating an executible binary image from an "as6502" listing? Apparently AMAC, and ASMED do not allow for "inline hex code". I don't have MAC-65 or "ACTION!". Is there some type of program that can add a checksum to the end of a hexadecimal text line so that it can be read by a decoder? Will FORTH accept straight hexadecimal text, or does it need to be broken up into "screens" of data first? Perhaps I can modify a "machine language entry" program from one of the old ATARI 8-BIT magazines (at least that is my first thought...)? Is there a better program called "as6502", one with a "-v" flag? Perhaps I am using the wrong "as6502"? I don't want to reinvent the wheel if a simple solution exists already. I suppose if worse comes to worse I can always enter the entire source code suite by hand, but if there is a short-cut... I would rather take it. I guess that resorting

to some kind of hex code loader program using BASIC pokes wouldn't be
--TOO-- awful, but why was the work on "makebin.c" abandoned? Obviously
a simpler solution must exist already! Hmm....

37. 1050 Stepper.

Newsgroup: comp.sys.atari.8bit

Message-ID: <detobin.726243140@unix2.tcd.ie>
Source record: 108449

Has anyone had problems with the stepper motor in the 1050
drive. The one in our drive at home died, the magnet on the
spindle cracked and came off, however we fixed it with
superglue. So what I want to Know is if this is a common problem
and if it can be prevented, or what caused the problem at all
(it is possible that the drive was dropped from a height,
younger brothers you know). More importantly can this stepper or
an equivalent be purchased (N.B. I live in Ireland).

Donal.

39. Classic Atari Cartridges

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-05 18:29:19 UTC
From: chase@electron.rutgers.edu
Message-ID: <Jan.5.13.29.18.1993.21474@electron.rutgers.edu>
Source record: 108451

Here is a new edition of the Classic Atari Cartridge list.

There were a few responses to my last posting of this list, so I hold out hope that I can make some more progress completing the list. Additions, corrections, and words of encouragement can be deposited in my mailbox. I am especially interested in finding out the serial numbers of some of these carts, especially Activision, Sega, CBS Software and Parker Brothers carts, since they should be fairly common.

I'd like to thank the dozens of people on the net who have contributed to this list. Without their help this project would have never gotten anywhere.

Activision CZ-001-04 83 River Raid
Activision CZ-002-04 83 Kaboom!

From: jjmcwill@mtu.edu
Message-ID: <1993Jan6.010420.9900@mtu.edu>
Source record: 108452

In article <C0DJxn.7MI@merk.com> winston@merk.com (Winston Smith) writes:
>
>
>
>"The saga of 'makebinary.c'...."
>
{ lots of stuff deleted.... }

Okay, let me get this straight, as6502 works, it assembles the
assembly language, and produces something like:

FF FF 1B 3C 4A A2 A3

Written as a text file... where the above would be 20 bytes long, and
if you read it as numbers, you would read the following:

70 70 32 70 70 32 49 66 32 51 67 32 52 65 32 65 50 32 65 51

Makebin.c was supposed to take the text file, and turn it into
an actual binary file. But it didn't, and now you want to make
a program that does.... is this correct?

Jeff

41. 800XL expansion port

What is that parallel port on the back of 800XL's for? I was told when I
bought mine (1984) that it was "for future use".
How would one send information to that port?

Let me tell you what I want to do:
I want to transfer text files created in AtariWriter over to IBM. I know you
have the files at the archive for reading Atari disks on IBM's, but can you do
it another way? For one, I don't have beyond DOS 3.0 on Atari, but I've got
MS-DOS 5.0 for IBM.
Could I send ascii characters out of that port or the printer/all-purpose
port and into some IBM port? I just want to put these files onto my hard drive
as text files.
Or is the easiest way to do something like this to use those files?
But you have to hook up your Atari disk drive to your IBM or something?
I have a 1050 Atari disk drive.

Jeff,

Okay, the Parallel Bus Interface can allow you to plug in several
devices, the K-Products (formerly Supra) Interface, an ICD MIO,
or the Computer Software Services Black Box.

The K-Products interface, from what I know of it, is a SCSI hard disk
drive interface.

The MIO is a SCSI/SASI hard disk interface, printer interface,
modem interface, and has RAM which can be used as a printer spooler and/or
a RAMDISK.

The Black box has a SCSI/SASI hard disk interface, modem interface,
printer interface, optional 64K RAM for a printer spooler, optional
floppy disk drive interface, and has a 6502 monitor/debugger, and an
optional disk editor/fixer.

BEST Electronics sells an MPP Microport Experimenter's kit that has a
Peripheral Interface Adaptor chip on it, so that you can experiment
with all sorts of electronics projects with it. The book shows how
to biuld an LED Clock, and a simply EPROM burner. You could also use
it to experiment with Analog to Digital conversion, Digital to
Analog conversion, sound digitization, or a do it yourself printer
interface. It's only limited by your imagination.

Bob Woolley of the San Leandro Computer Club also did a Parallel Bus hack called the PIO interface, which took your expanded 256K computer, and created two 90K disk drives out of it. You could then copy, say, an Infocom game into the Ramdisk, and boot and run the Infocom game totally out of RAM. I didn't do this hack, but it sounds really neat. Infocom games were notorious for always accessing the disk drive all the time. These games would be blazingly fast with the PIO device.

As far as trasferring files between your 8 bit and your IBM PC. Well, you COULD build something yourself on the PBI, and write your own software, to communicate with the IBM, and put the IBM's printer port in INPUT mode... but geeze... it would be just as easy to bild the SIO2PC interface, which plugs into your IBM and your Atari, and lets you create Atari floppy disk "partitions" on your IBM hard drive.. then you simply write to the IBm hard drive from your Atari, as if it were a floppy disk.

Another alternative would be to get a modem interface, and run a null-modem cable between your Atari modem port and your IBM modem port. Then use something like Kermit to transfer files at 9600 baud.

Those are pretty much THE alternatives. Hope this helps.

Jeff

jjmcwill@mtu.edu (Jeff McWilliams) says:

> Makebin.c was supposed to take the text file, and turn it into
> an actual binary file. But it didn't, and now you want to make
> a program that does.... is this correct?

Essentially, but not exactly. There are several solutions to this problem. I am just wondering what a "best case" scenario would be: using a UNIX system to create executible (fast with lots of space but not available to all 8-bitters) ? Loading the hex code "inline" on the 8-bit by using some programming language such as a PD version of FORTH that allows for inline code modules? Using a "BASIC POKEr loader" on the ATARI 6502 8-BIT (slow but universal) so that other hex code output can be loaded and saved? Programs to do such things exist already and need only be modified. I am just wondering what the accepted methodology is, not being an assembly language programmer by trade. Since "makebin.c" appears to have been abandoned I presume that a better method had been found?

My question is: What is the programming path to go from the 6502 assembler source code of KERMIT-65 that was posted on the ATARI archive to a working image of the binary executible? The cardinal rule is to usually "follow the MAKE file", but the final step in the "make" appears to have been abandoned only half-way completed (emphasis on "appears to be"... I suppose I am overlooking something that is entirely obvious, which is usually what is happening in cases like this).

44. easy-to-manipulate joystick?

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-06 14:36:19 UTC
From: sharrington@mpgs.enet.dec.com
Message-ID: <1993Jan6.144512.27165@engage.pko.dec.com>
Source record: 108358

My wife has recently gotten quite hot on the idea of
getting our 4-year-old daughter comfortable with computers. So,
since I still had my Atari system, I started setting it up for
my daughter. The only problem we foresee at present is with the
joystick: I'm not sure which one I have, exactly - it's a tall
red one, with a white fire button on top of the stick, as well
as a button on the base - but my daughter finds it very hard
to manipulate, because her left hand is not strong enough to
hold the base down hard enough so she can effectively manipu-
late the stick.

At one time, I had a nice little joystick: a cube-like
base, with a small stick that could be manipulated with liter-
ally just two fingers while you rested your wrist on the base.
The stick moved so easily, you didn't need to hold the base
down at all. Something like this would have been perfect for
my daughter, but - unfortunately - that particular joystick
broke some years ago.

Anyway, what I was wondering is: can anyone point me to
a source for some easy-to-manipulate joystick appropriate for
my daughter? Or, if anyone happens to have a joystick like the
one I described in my 2nd paragraph... would you consider sell-
ing it?

Thanks for any help.

There is one other alternative. You can hack a joystick cable for about $2 & use it to tie into the IBM's serial port. There's a couple of handlers that will work with this set-up. Chilcott (SP?) is one. You're limited to 300 baud for Xmodem transfers though.

Well, I would say some sort of program that loads in the file, and writes out
a binary using the 8 bit would seem to be the best way. On the other hand,
since this problem only crops up with you are using a cross assembler on a
unix machine, perhaps you should just write the executable maker in
unix and put it with as6502.

Source record: 108360

I'm well aware of what the MIO can handle. What I'm curious about is if there were some form of adapter I could use to convert the floppy connector (on this 8" drive, its a *50* pin connector) to the hard drive port on my MIO. I'm sure there HAS to be a way. 50 pin is 50 pin!

I just downloaded Jeff Potter's and Chuck Steinmen's AGDADEMO.ARC
GEnie last night and its a demo of the multiplayer, multi-computer
game they were writing...pretty interesting! Its only a one player
demo but the real thing can use 8 computers hooked together. Its a
fast maze game where you can have 8 other people in the maze at the
same time along with granades.
Its only a preview to the soon to be released real thing. Looks real
interesting.

Well, Hey! Don't hoard it all to yourself, if you can, upload it
to the Atari archive so that rest of us can get our greasy claws on it.

(grin!)

50. Re: Wish List

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-07 02:03:11 UTC
From: Jim_Johnson@abcd.Houghton.MI.US
Message-ID: <Jim_Johnson.0bz3@abcd.Houghton.MI.US>
Source record: 108363

An earlier message discussed the availability of XLent's word processor. I never used their word processor, but XLent's database application, MegaFiler was quite nice for a low end product. In many ways it was much better than SynFile+ - AND MegaFiler would run under SpartaDOS, which also meant it could run from a hard drive.

As for word processors I used three: AtariWriter Plus (AW+), TextPro Plus (TP+), and PaperClip 3.0 (PC). The best and the worst was PC. The built-in DOS was a royal pain in the behind, but it was the most powerful of the three. I did figure out a way to make it run like streaked lightning tho'.

I DiskCom'ed the program and dictionary disks and kept the files on my hard drive which ran under SpartaDOS X. I also had a one meg MIO with several standard floppy size ramdrives. I wrote a SDX batch file which
1. ran a utility to "format" my MIO ramdrives as AtariDOS directory structure drives.
2. "Unpacked" my PC disks from the hard drive into the MIO ramdrives.
3. ran a utility to renumber the system drives with the "PC" drives as 1&2.
4. rebooted the system.

PaperClip loaded almost instantaneously from the MIO ramdrive. I then requested to look up a word in the spellchecker. Because my 130XE had 320K of RAM, the entire dictionary was then loaded at high speed from the MIO into the extra memory on the 130XE. I then manually popped up the MIO drive configuration menu and put my real floppy drive as 2.

The system performed a reset as I returned to PaperClip, but the spelling dictionary was already loaded into the 130XE's ram.

The above process took a total of 20-30 seconds and the result was a very high speed word processor with NO disk shuffling.

eba@happy.cc.utexas.edu

55. Awesome demo - Won't work!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-07 15:18:27 UTC
From: svhowardm@npe.isnet.inmos.co.uk
Message-ID: <1993Jan7.151827.1@npe.isnet.inmos.co.uk>
Source record: 108366

Hello there-

Can any helpful soul out there tell me how to get a working copy of
the Awesome demo.

What I have done so far is :-

1) Ftp'd awesome.arc to my home account.
2) Copied onto a floppy and taken it home.
3) Uudecoded it
4) Unarchived awesome.dcm
5) Run Diskcomm (V3.2 12/87) and generated a disk image.
6) Rebooted with the newly generated disk and....

Nothing else - The Atari loads 3 sectors (I think) and then hangs.

So what did I do wrong???.

Thanks in advance..

Mark.

57. Screen Aided Management

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-07 16:19:42 UTC
From: rossi@opal.cs.tu-berlin.de
Message-ID: <1993Jan7.161942.4075@cs.tu-berlin.de>
Source record: 108367

Hi there !

Have you ever heard of a software package named S.A.M. ?

You are thinking of a speech synthesizer ?
Hmm, you're right and you are not right, too.

There is another software package out there. It is called

SCREEN AIDED MANAGEMENT (S.A.M.) .

What is S.A.M. ?

S.A.M. is a disk-based desktop for the ATARI XL/XE, but it is much more
than this...

* S.A.M. uses windows.

* you can work with 80 columns per row

* you have pull-down menues

* S.A.M. can be controlled by keyboard,joystick AND mouse

* You are able to lock/unlock/delete/rename files

* You can choose your woking disk drive (1-8)

* You can copy/format disks, read/write sectors

* You can show directories and create/edit/show a text of 80x16 bytes
without reduce the capacity of your DOS 2.5 disk

* You can start some utilities (I will describe them later in this text)

* You are able to start accessories.

* You can exit this program to DOS or boot system.

* This program is documented in a way which makes it easy to program your
own accessories and programs for S.A.M. (It's an open system).
This is because all your programs written for S.A.M have the chance to
use windows,pull-down-menues, 80 columns per row and all the other features
of S.A.M. .

Utilities :

There is a number of 6 utilities coming with S.A.M. which make it a
powerful software package for everyone.

a) Character Set Editor mono
b) Character Set Editor color
c) Memobox
d) Memory Monitor
e) S.A.M. Texter
f) painting program S.A.M. Painter

a) CHAREDITOR MONO

easy way to edit 8x8 fonts for GRAPHICS 0 or 8 (all mono).
Features:
LOAD - load a set with DOS fileheader or without
SAVE - save the edited set without a file header (DOS format)
OLD - copies the ATARI char set into the editor
CLS - zeroes the character set buffer
CLM - zeroes the actual selected character
COPY - copies a character to another
EXIT - leave CHAREDITOR and branch to S.A.M.'s main menu (without loading)

There five sections on the screen :
1. name of the program and EXIT icon
2. the 8x8 matrix of the selected character
3. all characters in order of their code
4. 4 (maybe 3 or 5 -can't remember) lines where you can combine
characters and see how the text will lokk (or the graphic made by the
font)
5. a menu line where you can choose what you want to do

b) CHAREDITOR COLOR

nearly the same as (a) with few exceptions.
You can create four-color fonts (for GRAPHICS 12,13,15...) on a 4x8 matrix.
There are three fields where you can choose the colors of your font (not
the backgroud color).
OLD doesn't produce the ATARI font (useless) but a ready-to-use four-
color font to the editor.

c) MEMOBOX

this is a powerful file manager.
You can manage up to 96 cards/files per disk side, each 32x16(=512)
bytes large. You have 4 cards in memory at one time. For each disk side
exists a catalog file where you can specify your files.

The menu line :

EDIT CREATE SPECIAL SHOW EXIT

Edit file# Create MEMOBOXdisk SEARCH IN PAGE SHOW PAGE DOS
SEARCH IN CAT. SHOW CATALOG S.A.M.
NEW WORKDISK
CHOOSE MASK
PRINT ON/OFF

It would be too much to say something to all these features and the special key combinations. You can work with input masks and you can copy cards and part of files to others and much more...

d) MONITOR

It's a memory monitor. Here it's features :

FILL - choose a part of the memory and fill it with a certain code.
CHANGE - direct change of memory (like POKE in BASIC but more comfortable)
FILE :
LOAD - loads a machine language program in DOS foramt
SAVE - saves such a program
DUMP :
ASC-DUMP- dump memory in hex- and in ascii-code
SCREEN-DUMP - shows memory in hex- and in screen-code
BINARY-DUMP - shows memory in hex- and in binary code
EXIT :
JMP ADDRESS - goes to a machine language program which mustn't end with an RTS
JSR ADDRESS - jumps to a machine language routine which has to end with an RTS command

e) S.A.M. TEXTER

This is one of the best text processing programs ever made...

The menu line :

STANDARDS OPTIONS FILE PRINT EXIT
---
left margin Clear directory preview DOS
right margin blank text save print S.A.M.
colours insert load -font
keyboard (german) delete format -parameter
keyboard (internat.) swap text
wordwrap move text
copy text
centre
grouped style
ungroupe
format text
(undo)

There are are lot of features not mentioned here (interrupt printings,set marks,write modi etc.).
Text will not be deleted if you exit to DOS or to S.A.M. .

f) S.A.M. PAINTER

128 color painting program, works like KoalaPad (but with joystick/mouse)

Icons :
-Draw -Line -Lines -Rays -Box
-Frame -Disk -Circle -Fill -Zoom

-Cut -Paste -Flip -Flap -Modify
-Text -Undo -Clear -Setcol -Graphics
-Choose Brushes -Choose Colours

menu line :
SAVE LOAD PRINT MENU S.A.M. Choose Pattern

function keys :

OPTION - loads the four colors of the selected row into the PATTERN line
START - saves picture to security memory
SELECT - changes color of the arrow
HELP - switches arrow between menu line and picture
RESET - return to ICON menu and UNDO
cursor keys - move arrow with tabulator steps

Most of the features are really great to handle.
You can produce pictures with overall 128 colors (4 in each line)
and there is a way to load those pictures to your own programs.
You also can load/save micropainter pictures (62 sector format).

Accessories :

The most amazing feature of S.A.M. (for me) is that you can load (and
write them for yourself) accessories from the main menu...
There are several ready-to-use accessories for S.A.M. :

g) multifile copier
h) S.A.M. text converter
i) tabular calculating program BUDGET (don't know if this is correct English)
j) S.A.M. Painter upgrader
k) Fireball (game)
l) S.A.M. Designer
m) S.A.M. Patcher V 1.0

g) MULTIFILE COPY

WYSIWYG. It works with icons for each file of the disk (like ATARI ST).
It knows three kind of icons :
- source codes (.SCR,.ASM,.BAS,.TUR)
- object files (.OBJ,.SYS,.COM)
- data files (all other endings)

It supports up to 4 disks and up to for RAMdisks (partitions).
24 icons are shown at once, you can scroll the window.
To copy a file just click it.
The program knows when you put a disk into a drive automatically.

A great utility (graphic-based one).
Get it!

h) S.A.M. TEXT CONVERTER

S.A.M. Texter uses it's own format to save files on disk.
This program converts this format to others an other formats to
the S.A.M. Texter format, so you can use YOUR texts with other programs
too.
SAM > ASCII
ASCII > SAM
ATARI Writer > SAM
Startexter > SAM
Austro.Text > SAM

(Startexter & Austro.Text are European (German and Austrian) products
with a high quality standard)

i) BUDGET

do calculation and tabular workings of all kinds...

You work with a worksheet of 16x64 fields (9x17 fields on the screen every-
time). Only move the arrow in the direction you want to scroll the screen.
You can work with number- operation- and text fields.

The menu line :
FILE EDIT CALC PRINT EXIT
---
save worksheet goto position calculate print all S.A.M.
load worksheet erase pos. clear results print columns a - h boot
save area clear all down column print columns i - p
load area clear row across row show printer info
format drive clear column left aligned
current drive move row right aligned
move column integer
copy row 2 dec. places
copy column
insert row
delete row
kill block

You work with a fileselector box (Greetings to ATARI ST).
To edit a field, just move the arrow on it and push mouse/joystick trigger.
You can work with operators (+ - * /) and functions.
SQ - square root
LO - ld(x)
LN - ln(x)
EX - exponential function (???)
AB - |x|
SU - adds fields
AV - average of fields
MI - minimum
MA - maximum

There is a keyboard buffer installed (whether or not your DOS uses one).

j) S.A.M. PAINTER UPGRADE ACCESSORY

features :

LOAD SECTORS - loads 62 sectors of a disk (not a file)
after this you can load others or leave this feature
LOAD FILE - loads a picture in micro painter format
WRITE SECTORS - saves 62 sectors on a disk
INIT DISK - formats disk in medium density (I guess)
DIRECTORY - shows directory, if you move the arrow on a file name
and push the trigger the file will be loaded
VERIFY ON/OFF - guess what this means
I/O SOUND ON/OFF- like POKE 65,0 or POKE 65,255
DRIVE 1/2 - you can choose your working drive between drive 1 and 2
MICROPAINTER - chooses the micro painter format (4 colors will be saved)
SAM-PAINTER - guess what this means
ENTER S.A.M. - go to main menu
ENTER DOS - go to DOS menu
COLDSTART - boot system

k) FIREBALL

you are working with S.A.M. desktop for hours and hours and now want to
relax a bit and play something to get new energy for coming tasks ?
But you don't want to leave S.A.M. at all and reboot it after playing a
while ?
Okay, here is a nice game for you using some S.A.M. features and using
the S.A.M. desktop.

Fireball is a breakout-like game with four different levels.
You can choose in the difficulty box between Beginner,Novice, Expert and
Special.
Special is like Expert level plus all the stones of the wall are invisible.

l) S.A.M. DESIGNER

High-Resolution-Drawing program (CAD)

it is one of the diamonds in this package...

only some of its features :

- all draw functions are gum band functions

- very fast FILL and UNFILL routines

- textfunctions with using different types of fonts, cursive and propor-
tional writing ...

- text created with S.A.M. texter can be loaded and placed on the screen
(with all their text attributes)

- Icon libraries (electronic elements, circuit database)

- CUT & PASTE

- as many printer driver as you want

- easy self producing of own printer driver

- all the 'normal' functions every good quality program for the XL/XE has

- and more...

- fast and easy to control

m) S.A.M. PATCHER V 1.0

a simple to use patch compiler for S.A.M.
write with S.A.M. texter your own patch listing and the compiler changes
S.A.M. like you want to...

- Memobox compatible to your printer

- texter compatible with other printers as the epson-compatible's
(like ATARI 1029 or ALL the pseudy epsons)

- make multifile copier compatible to floppy drive XF551

- patch the color combination of S.A.M.s main menu

...

Still there ?
You're missing a program for your special problem ?
If you (or someone you know) know assembly language and have time to
solve the problem you can easily program your own accessories for S.A.M.
(and maybe give them to the community of S.A.M. users)

And here is how it goes :

ATARI 800 XL memory (when S.A.M. is installed)

```
$0000-----------------------------------------------
OS variables and vectors
$0600-----------------------------------------------
S.A.M. variables
$0700-----------------------------------------------
DOS
$1F00-----------------------------------------------
free memory
$2400-----------------------------------------------
S.A.M.
$2600-----------------------------------------------
free memory (but is temporary used by S.A.M.)
$3000-----------------------------------------------
font
$3400-----------------------------------------------
player graphics
$3800-----------------------------------------------
S.A.M. vector list
$3900-----------------------------------------------
S.A.M.
$6010-----------------------------------------------
```

```
Screen
$8000-----------------------------------------------
S.A.M. utility
$xxxx----(depends on length of utility)-------------
free memory
$C000-----------------------------------------------
.
.
.
```

The utility which loads the accessories and controls them uses
the memory from $8000 to $83FF.So, S.A.M. accessories are machine
language programs executable at address $8400.
There are three kinds of accessories :
1) 'free' accessories; they don't use any S.A.M. routines/variables
and they don't return to S.A.M. Those accessories may allocate the
whole memory of the XL.

2) 'semi-free' accessories; they don't use any of S.A.M.'s routines/
vaiables and return to S.A.M. . Those accessories must not touch the
memory which S.A.M. needs.

3) S.A.M. accessories; they use S.A.M.'s routines/variables and return to
S.A.M. . See 2).

The menu screen of S.A.M. is still active when the accessory starts.

There is a list of S.A.M. system variables and routines (quite nice and
quite a lot of stuff).
Please gimme a hint if you want further details.
If no one answers, I take your disinterest for granted.

Hack a joystick cable?
How do you send information out of the joystick port?
Or did you mean to wire it up between the all-purpose jack in the back on
the right and a serial port on the IBM? So would I hook it up to my modem
port and use my communications software to capture text coming in, then dowload
it?

Floppy drives and hard drives are VERY different creatures. You would
NEVER be able to run that 8 inch floppy off of a SCSI port.

There are two ways you can run that 8 inch floppy on your 8-bit:

1) With an ATR-8000
2) With a CSS Black Box that has the Floppy Board upgrade. The Floppy
Board will let you run pretty much any floppy drive on the 8-bit,
including 1.44MB and 1.2MB high density.

Hi !

This time I want to ask if some of you want to sell their old
A.N.A.L.O.G. computing magazines.

I'm looking for all issues which are in good shape with the following
exceptions (which I own for myself) :

Dez 85
July 86
April - May 88
July 88
Oct 88 - June 89
Sept 89 - Oct 89

I request NOT the issues listed above, but all other issues published.
Thank you for your answer via email (to rossi@cs.tu-berlin.de).
I will pay a fair price and the postage.
PLEASE, I NEED THEM...
Contact me via email, so we can talk to another and do the detail work.
THANK YOU IN ADVANCE...

Message-ID: <1993Jan7.192440.14419@mtu.edu>
Source record: 108371

Okay, I got some questions about this program:

Is the documentation in German, or has it been translated to English?
Are the messages and menus and stuff that S.A.M. shows on the screen
in English?
This CAD program, what sort of screen resolution is it?
Is it basically a drawing package where you put things on one graphics
8 screen, or can you create a page that is 4 screens wide by
6 screens long, draw on it, and then print it out on a printer at a
high resolution?
How much does it cost, and is it available to us U.S. users?

Subject: FAQ vs. CSA8/Berkeley Com Problems
Status: O

[Jeff, please forward to the csa8 newsgroup, thanks!]

This one is for Michael Current.

In the recently posted FAQ list you state:

"To contribute to the Info-Atari8 Digest, send your posting to comp-sys-atari-
8bit@....
Please note: there is NEVER a good reason to to send anything to the address
Info-Atari8@naucse.... "

Well Michael I must take exception to that. It was good advice up until the
first week of November. After 2 years of active participation in this news-
group, during the first week of Nov. all my postings to csa8 suddenly started
bouncing. Notice I don't put in much appearance here lately? A few folks
have even wondered where I've been lately, & guys like Jeff McWilliams have
sorta been standing in for me.

When the problems began I wasted a lot of time with sysadmins at my end, as I
thought the sudden disruption had something to do with yet another of the
endless rounds of "upgrades" these people are always doing here (sometimes
with disastrous results). Eventually I found someone here who was halfway
competent who demonstrated to my satisfaction the problem wasn't at my site.
```

I sent an e-mail inquiry to the Postmaster at Berkeley about the problem. Those bums took like 2 weeks to reply. There story was that they had taken some disk drives offline & reallocated them to other use which had apparently been employed in retransmitting Internet messages sent to csa8 back out onto USENET. They informed me in a kind of terse, cryptic style that c-s-a-8 was for "local" users only. I'm in Pennsylvania, 3,000 miles away, I guess that's not "local". So outside of a certain geographical radius, Berkeley has cut off all the non-locals like me. I'm reduced to being able to read the Digest on Internet without being able to respond. The frustration has given way to depression.

So, if we aren't to send messages to IA8 (only the Internet people see them if you do), just WHERE should we now send our responses if Berkely isn't going to forward stuff to USENET any more?

Thus my exception to the statement "there"s NEVER a good reason to send to Info-Atari8...". Well, *I* have a good reason: Berkeley has cut me off & now bounces everything I send to c-s-a-8. I'm sure I'm not the only person affected by this. Any hope of someone setting those Berkely people straight & letting us "non-locals" post again? Or, is there some other address we can use that will cross-post to USENET like Berkeley did?

I really HATE this feeling of isolation.

Source record: 108376

By now Ben has seen my posting "Posting from the Internet: we have a problem." I gather they probably sent you the same little message they sent me.

I completely understand your frustration, as apparently ucbvax.berkeley.edu is not going to be available to any of us anymore.

All I can do about it is what I've just done tonight: I've updated the FAQ List , indicating that indeed Info-Atari8 Digest subscribers pretty much are unable to participate in this group now. And I've e-mailed John Dunning about the situation, thinking that as the maintainer of the Digest he might have some concern.

I still consider the primary problem, which has been the case ever since the Info-Atari8 Digest moved to naucse.cse.nau.edu oh, say, 3 years ago, to be that mail sent to info-atari8@naucse.cse.nau.edu is not cross-posted to comp.sys.atari.8bit as it is supposed to be.

Again, if anyone has any ideas on how to fix the Digest to do this, please post here (on Usenet!) and/or e-mail John Dunning. We really need to get this thing solved.

jjmcwill@mtu.edu (Jeff McWilliams) writes:

>Okay, I got some questions about this program:
>
>Is the documentation in German, or has it been translated to English?
There is a good German documentation for SAM. But one of the authors
told me someweeks ago that they work on an English version of it.
I can't say, if the English documentation has been published already.
If you want to have detailed info about that fact write a mail to
hs@cnve.rrze.uni-erlangen.dbp.de .

>Are the messages and menus and stuff that S.A.M. shows on the screen
>in English?
Oh yes. I can't speak for accessories I didn't describe in my posting
but I'm quite sure, that all pull-down commands are in English (and I
guess that the rest is in English, too - mail me, if you want to know it
for sure and I will take a look at it at home).

>This CAD program, what sort of screen resolution is it?
Well, 320x192 (It may be that it is 320x190 or similar, haven't worked with
it for a long time - xl abstinence)

>Is it basically a drawing package where you put things on one graphics
>8 screen, or can you create a page that is 4 screens wide by
>6 screens long, draw on it, and then print it out on a printer at a
>high resolution?
I'm not sure. This is because I only have the full description of SAM and its
utilities (plus some accessories). I have a copy of the CAD program at home
but no description of it because at the time I got it there was no description
for it. But now there is one. It may be that this is only a one-screen-picture
CAD program but if you're able to program in ml you can do it for yourself.
I have all the details how to program SAM accessories.
Wanna have them...gimme a hint.

>How much does it cost, and is it available to us U.S. users?
Okay, there is a company here in Germany selling this stuff.
SAM (Main program and all utilities) 49 DM ca. $31 +shipping
SAM accesories (without Designer) 24 DM ca. $15 +shipping
SAM Designer 19 DM ca. $12 +shipping
SAM Patcher 12 DM ca. $08 +shipping
---
104 DM ca. $66 +shipping

If you buy all in one it will be only 79 DM ca. $50 +shipping

If this company has plans to give the distributing rights to an US company
is not sure but you can ask them for yourself ...

Power per Post (PPP)
Postfach 1640

Actually, the joystick ports use a 6520 PIA chip so with software they can do I/O. Do you remember the MPP Modems that hooked up to joystick port #2? A few handles were written to give them the "Hayes" command set & a few other features. I mostly did the hack for people that didn't want to spend $50 to $200 to get an interface so it's not like I did a real great job<grin>. I got it working with a couple of RS232 devices then took a break. I've already U/L'd it in the message base so if you're interested I could send it E-mail. There's some stuff you'll need to find like the handlers which should let you run your own basic progam/Amodem or get a copy of Express.MPP. I don't want top bother with UEE'ing the binaries if at all possible. It's cheap, but it works.

68. Genealogy prog.

I have for sale a 155meg Seagate 4182N SCSI hard disk (512k bytes).

I would like to get around $250.00 for it or best offer.

At the same time, I am looking for a 128 or approximate MFM or RLL or
256k byte SCSI hard disk. If you have such for sale or are interested in
mine, please contact me at:

this network at: uplherc.upl.com!neb!bbs!1fa or voice at: 801-969-5988
(jim King) or via this network to Genie (last resort) at:
j.king73@genie.geis.com

Tried to hook the 155meg SCSI to my 8bit MIO, but since it only works in
512k byte mode, its useless to me! ARGH! Money wasted, I suppose!

I agree with you that 50 pin is 50 pin, but 50 pin can be SASI, SCSI, or a
proprietary array of signals. *maybe* there is a way, but be prepared to
hack a long time and to write your own handler.

> better than SynFile+ - AND MegaFiler would run under SpartaDOS, which also
> meant it could run from a hard drive.
>
The First Xlent Word Processor is just that - excellent. I have used it for about five years and it has served all of my needs just fine. It has some unique features in: joystick control, double column option, graphics capabilities, and a screen that will print your document in 80 columns - without an XEP80!

It will also work with most of Xlent's other programs I believe. There's probably some other options on it too, but I mostly just use it for simple letters or assignments.

If you're wondering about cost, I think I bought it for $22 in 1987.

>* bellas@gamma.tti.com *

Pete,

If you have a modem connected to your 1200XL, you could use Kermit-65
to transfer files from your Sparc to your computer.

I finally found an ARCing utility that I successfully compiled on
our Sparcs in the EE department.. funny, the NeXT machines choke on the
same set of code.. some compatibility! Anyway, that way, you could
FTP directly to atari.archive.umich.edu, use binary mode to get the stuff,
and de-arc it on your sparc to look at it if you want. THen, uuencode
the arced file, and use Kermit-65 to transfer it to your 8 bit computer.
Then you uudecode it and use SuperUnarc from Bob Puff, and you're ready
to go.

Of course, this all assumes you have a modem.

If not, there are programs that will write true double density Atari disks
on an IBM PC compatible. You would need a true double density drive
though. Stock 1050's only do single or 1 1/2 density.

By the way, folks. If you have trouble getting hooked up to
atari.archive.umich.edu.. you can also try wuarchive.wustl.edu,
in mirrors/atari.archive.umich/atari/8bit/ as it is the same stuff.
I think maybe atari archive tells you this when you try to connect
for anonymous FTP and there are already too many users.
Bart seems to be working again, which is good news if you don't have
FTP access.

73. AGDADEMO.UUE (arc) multi-machine game

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-09 23:21:49 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1993Jan9.232149.3664@news.ysu.edu>
Source record: 108385

I just uploaded (bart style) the new multi-machine, multi-player
game AGDADEMO.ARC to the archive. I don't know when he will put it
up but it in his mail box right now....the following is the blurb
from GEnie:

```
*********************************
AGDADEMO.ARC
Address: JDPOTTER Date: 921230
Approximate # of bytes: 13184

Description:
This is a demo version of the soon to be released "Maze of Agdagon" multi-
player real-time graphics maze game. This lets you get a taste of how the
game dynamics work. Please leave feedback here in the "computer games" forum
(section 4) until a section is set up in the AGDA forum (section 11).
Enjoy!

74. Atari ST system 4 sale...

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-10 05:34:59 UTC
From: aj743@cleveland.Freenet.Edu
Message-ID: <1ioci3INN375@usenet.INS.CWRU.Edu>
Source record: 108386

I have an Atari 520ST system for sale. Every thing is in great condition and has been treated with loving care. I have recently moved on to a new system and would like to find a home for my Atari. I am asking $400.00 or best offer for everything plus shipping. If you have any questions please send E-mail...

HARDWARE:

Atari 520ST
- 68000 16bit CPU at 8MHz
- 512k RAM
- RF modulator for connecting to your TV
- Atari two button mouse
- TOS operating system with GEM graphical user interface
- Two joysticks
- Connector to add two joysticks for four players

Two Atari SF354
- Single sided disk drives
- Uses 3.5" disks
- Will format to 360k

Master 3S
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Rio Datel Disk Drive
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Atari SMM804
- 9 pin printer
- Cable
- Paper

SOFTWARE:

All software is like new and includes manuals...

-APPLICATIONS-

Flash
Shadow
WordPerfect

-GAMES-

Advanced Dungeons & Dragons: Heroes of the Lance
Better Dead Than Alien
Alien Syndrome
Barbarian
Batman: The Caped Crusader
Dungeon Master
Chessmaster 2000
Exolon
Falcon: The F-16 Fighter Simulation
Formula 1 Grand Prix
Gauntlet
Gauntlet II
Hitchhiker's Guide to the Galaxy
King's Quest III
Leader Board
Leather Goddesses of Phobos
Leatherneck
Outrun
Hyperdome
Moon Patrol
The Pawn
Phantasie
Phantasie II
Phantasie III
Test Drive
Star Fleet I: The War Begins
Sundog
Thrust
Starglider
Star Wars
Space Quest
Star Trek: The Rebel Universe
Thunder Blade
Time Bandit
Ultima II
Exodus: Ultima III
Ultima IV: Quest of the Avatar
Plutos
Vectorball
Xevious
Uridium
Robotron: 2084
Warhawk
Wizard's Crown

OTHER:

Lots and lots of Atari ST specific magazines...

Cross-posted to: comp.sys.atari.8bit,uw.forsale,seattle.forsale,misc.forsale,misc.forsale.computers,pnw.forsale

Atari 8-bit Computer System for Sale, and materials..

I have the following equipment for sale..
.....
Atari 130XE, Stock no modifications, hardly used, original
packaging..
$50.00 obo

Atari 600XL, 256k upgrade/compatible with 130xe standard, no
power supply..
$40.00 obo

Atari 1050 Disk Drive, US Doubler Mod to double density,
higher transfer rate..
$50.00 obo

Atari XM301 300 Baud Modem
$10.00 obo

Atari Touchtablet, w/original cartridge software, and
packaging, hardly used.
$20.00 obo

Atari Trackball, and 6 assorted brand joysticks for atari
computers, and game system.
$10.00 obo

The following 7 cartridges w/original docs if applicable,
$5.00 each, or $20.00 for all.

Atari Assembler/Editor #CXL4003 (w/docs)
Basic XE Programming language (w/docs)
Pilot Programming langauge (w/docs)
Star Raiders (Always a favorite, and a classic, w/docs)
Missle Command (Comparable to the Arcade version, w/docs)
Centipede (Comparable to the Arcade version, w/docs)
Star Trek (w/docs)

The following book copies available, for system and software
programming..
Take all for $5.00 obo or free if you buy system..

De Re Atari
Mapping the Atari
Kids and the Atari by Edward H. Carlson
Atari 400/800 Basic Reference Manual

Atari 400/800 Operating System User's Manual
Atari 400/800 Hardware Manual
Basic 8 utilities
Getting to know your Atari
Compute's Second Book of Atari
Master Memory Map by Robin Alan Sherer
Antic Magazine Sept 1984 through Dec 1988
PSAN (local magazine) Jan 1986 through Jan 1989

All books are very informative in programming the atari 8-bit computer, most reference the older 400/800, but all have universal information for programming the 8-bit atari computer.

The following software is available free when you buy systems.
Sparta Dos Construction Set V3.2
SynFile +
Atari Writer +
Print Shop
Print Shop Companion
Disks full of pictures for the print shop program.
Also a Disk Box containing about 50-80 disks with various software apps, and games, and utilities. I haven't looked in a long time, and really can't take time to list all here..

I also have various hard copy printouts of modem programs, games, apps, which you are welcome to..

I had a lot of good times with this system, and I am sure someone else can get many hours of enjoyment out of it, but as all things happen, we move on, now I need money for my new system, which is why I am selling this one.. All prices are fairly firm, but make me an offer, I just may take it. If anyone is interested I would be willing to let it all go for around $180, but you get everything, any takers?? Buyer pays shipping.. If you are interested please reply e-mail..

Gaia@carson.u.washington.edu

76. S.A.M. Part II (Accessory and address)

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-10 18:01:04 UTC
From: rossi@opal.cs.tu-berlin.de
Message-ID: <1993Jan10.180104.16978@cs.tu-berlin.de>
Source record: 108388

Hi there !

Last week I posted an article covering the program Screen Aided Management
for the ATARI XL/XE computers.
I have been asked several times where you can get it and some other
things. So I decided to write it down and post it here :

Screen Aided Management (S.A.M.) is powerful software package. It gives the
XL/XEs a desktop with windows/icons pull-down-menues and 80 columns per row
(and many other great features I described before - If you wanna have the
first text send me a mail (rossi@cs.tu-berlin.de).).

S.A.M. is a commercial product. Its basic parts had been published in 1988/89
in the German computer magazine ATARImagazin .
Now it is distributed by a German company. Here is its address :

Power per Post (PPP)
Postfach 1640
7518 Bretten
Germany

You may also get there other products for the 8 bit ATARIs, so be clever
and order a catalog first.

The newest version of S.A.M. is V1.25 and it seems that this is the last
update. The authors of S.A.M. are working on an English version (the software
itself/commands/... are in English but the manual is written in German) of
it which will be distributed in the US. But I can't say when.

Some people wrote me that they want to hear more about how to program
accessories which are compatible to S.A.M. . Okay, here it is. There
may be some lines of my first posting of it but this is for those who
didn't catch it.

S.A.M. has the ability to start accesories to give the progammer a chance to
use all the features S.A.M. is providing.
There are still some accessories out there. They were mentioned and described
in my first posting. I'm actually working on an accessory (a Filelist utility).

Okay here, again, is the memory map of the 800 XL having S.A.M. installed :

```
$0000-----------------------------------------------
OS variables and vectors
$0600-----------------------------------------------
S.A.M. variables
$0700-----------------------------------------------
DOS
```

```
$1F00-----------------------------------------------
free memory
$2400-----------------------------------------------
S.A.M.
$2600-----------------------------------------------
free memory (but is temporary used by S.A.M.)
$3000-----------------------------------------------
font
$3400-----------------------------------------------
player graphics
$3800-----------------------------------------------
S.A.M. vector list
$3900-----------------------------------------------
S.A.M.
$6010-----------------------------------------------
Screen
$8000-----------------------------------------------
S.A.M. utility
$xxxx----(depends on length of utility)-------------
free memory
$C000-----------------------------------------------
.
.
.
```
The utility which loads the accessories and controls them uses
the memory from $8000 to $83FF.So, S.A.M. accessories are machine
language programs executable at address $8400.
S.A.M.s title screen is still active when an accessry starts.

There is a number of system variables an accessory can work with :

XPOS Byte $0601 horizontal position for PRINT routine (00 - 79)
YPOS Byte $0602 vertical position for PRINT routine (00 - 23)
VALIN Word $0603 univarsial variable, mostly used to carry parameters
VALOUT Word $0605 as VALIN ; if routine gives back a parameter it is this
PULLF Byte $0607 0 - no Pull Down Window (PDW) open
1 - there is a PDW open
STORE Byte $0609 intermittent memory for flags and registers
PULLX Byte $060A x position of PDW (00 - 79)
PULLY Byte $060B y position of PDW (00 -23)
PULLH Byte $060C length of PDW
RMARG Byte $0611 right margin for CPRINT routine
BMARG Byte $0612 bottom margin for CPRINT routine
LMARG Byte $0613 left margin for CPRINT routine
XARR Byte $0614 x position of joystick/mouse arrow (00 - 159)
YARR Byte $0615 y position of joystick/mouse arrow (00 - 191)
PULLN Byte $0616 number of choosen desktop menu item (doubled)
COLL Byte $0617 0 - arrow outside PDW
1 - arrow inside PDW
BOXX1 Word $0622 x positon of the top/left corner of the box made by the
BOX routine (00 - 319)

BOXY1 Byte $0624 y position of the top/left corner of a boxmade by the
BOX routine (00 - 191)
BOXX2 Word $0625 x position (bottom/right); for BOX routine
BOXY2 Byte $0627 y position (bootom/right); for BOX routine
BOXSL Byte $062C X position for BOX slider (00 - 207,
>200 --> disabled)
TEXT Word $062D address of the string given back by the GETHEX routine
DIRFL Byte $0634 0 - show the "FREE SECTORS" message with the directory
in the SHOWDIR routine
1 - don't show this message
ILEN Byte $0635 maximum length of the input in the INPUT routine
(up to 45 !)
FILE String $5555 cotains choosen file after SHOWDIR routine
DRIVE Byte $507C actual drive number (ASC code)
IBUF String $5568 contains input after INPUT routine
MMU Byte $00EC 0 - memory (from $8200 to $BFFF) changed or used
This byte has to be set to ZERO in each accesory !!!

The zero page variables $CB to $F0 are also used by S.A.M. but can be also
used by an accessory.

There is also a number of system routines you can work with :

name adr job

PULLDOWN $4039 opens PDW (latitude is 16 characters)
Input :
X register - x position
Y register - y position
A register - length
Output :
PULLX,PULLY,PULLH,PULLF
PULLUP $40E1 closes PDW
INPUT $4F83 reads a text string from keyboard
IMPORTANT: You have to save PULLF before use the INPUT
routine and you have to restore it after
returning from it.
Input : ILEN - maximum string length
Output: IBUF and following - text string
A register - ESC pressed (1)
or not (0)
GETHEX $4BE0 writes text string to status row and reads hex value
from keyboard
Input :
TEXT - pointer to text string
Output :
VALIN - hex value
A register - ESC pressed (1) or not (0)
PRINT $43E1 writes text to screen or in PDW if open
Input :
XPOS - x position

YPOS - y position
X register - Highbyte of the text string address
Y register - Lowbyte
A register - length of the text string
CPRINT $43FF writes text in screen chapter
Input :
XPOS - x position
YPOS - y position
$CC - Highbyte of text string address
$CB - Lowbyte of text string address
X register - length of the string
LMARG,RMARG,BMARG - see description
ARROW $40F6 controlles joystick/mouse and moves the arrow
returns when trigger is pressed
Output : XARR, YARR - joystick/mouse position
GETDIR $4F2B loads directory in the buffer at $2B00
Input : DRIVE - drive number
SHOWDIR $4D85 shows directory, returns when file is chosen or button
pressed in the MENU line
IMPORTANT : Before you start SHOWDIR you have to
call GETDIR and open a PDW (x=32,y=2,
length=17)
Input :
DIRFL
Output :
A register - 0: file chosen
1: exit (button in menu line pressed)
FILE - Filename
BOX $4CFB draws rectangle and sets slider
Input :
BOXX1,BOXX2,BOXY1,BOXY2 - see description
CLRSTAT $5031 clears status lines (row 22 and 23)
IMPORTANT: save PULLF before and restore it after using
this routine.
PUSHBS $4489 copies screen to screen buffer
PULLBS $44D3 copies screen buffer to the screen
MULT $453D multiplies two integers
Input :
VALIN - integer #1
VALIN +1 - integer #2
Output :
VALOUT - result
CHAROUT $4376 prints character on the screen
Input :
XPOS,YPOS - position
A register - character code
ARRSET $417A sets arrow to a certain position
Input :
XPOS,YPOS - position
SAM $401F Return to S.A.M.

the S.A.M. graphic and menu line will be rebuilt

The menu line stuff :

This is a bit more complex, so be sure that you are really willing to follow through...

S.A.M. wasn't originally created to be an 'open' system. So there are no administration routines for the menu line and the pull down menues suitable in accessories.
You have to write your own (and I show you in this text how it goes).

To create a menu line you have to print 80 characters in line 0.

```
...
LDA #0
STA XPOS
STA YPOS
LDY #DATAFIELD
LDX /DATAFIELD
LDA #$50
JSR PRINT
...
```

DATAFIELD has to be a data field as this :

```
DATAFIELD .AT "FILE OPTIONS EXIT "
.AT " "
```

To let the user choose a PDW from the menu line you have to do this loop

```
...
LOOP JSR ARROW
LDA PULLF
BNE WOPEN
JSR CHOOSE
LMP LOOP
WOPEN JSR WCHOOSE
JMP LOOP
```

If you want be let things happen while waiting for the user to choose a PDW it must happen in this loop (or in an interrupt routine).

As you see there have to be two routines : CHOOSE and WCHOOSE.
But there have to be also another three data fields :

1) DTAB (for the menu line) :

Byte 0: number of entries
Byte 1: left margin for first entry (00 -79) in the 80 character string DATAFIELD
Byte 2: right margin for first entry
Byte 3: left margin for second entry
Byte 4: right margin for second entry
...

```
or with the data field mentioned before

DTAB .HX 03000311171D20

2) TXTAB (to control the menu lines' PDWs) :2) TXTAB (to control the menu lines' PDWs) :

In this field 4 bytes are reserved for each menu line entry. So the length
of this field is /number of entries/ * 4 .

Byte 0 : number of entries in pull down window (PDW) #1 (*16)
Byte 1/2: adress of the string where all PDW#1 entries are specified
Byte 3 : ZERO (0)
Byte 4 : number of entries in PDW #2 (*16)
Byte 5/6: adress of the string where PDW#2 entries are specified
Byte 7 : zero
...

or in our example :

TXTAB .HX 40
.DA PDW1
.HX 00
.HX 10
.DA PDW2
.HX 00
.HX 20
.DA PDW3
.HX 00
PDW1 .AT "Load Save Directory Format "
PDW2 .AT "Destroy ATARI "
PDW3 .AT "Exit to S.A.M. Boot system "

3) VECTOR (32 bytes for each PDW) :

This field contains the start addresses for all the routines represented by
a PDW entry.
You can put 16 entries together in one PDW routine and there are two bytes
reserved for each entry, so this field must have a length of 32*(number of
PDWs) bytes.

Byte 0/1 : start address for routine represented by entry #1
Byte 2/3 : start address for routine represented by entry #2
.
.
.
Byte 30/31 : start address for routine represented by entry #16

or in our example :

VECTOR .DA LOAD,SAVE,DIR,FORMAT,0,0,0,0
.DA 0,0,0,0,0,0,0,0
.DA DESTROY,0,0,0,0,0,0,0
.DA 0,0,0,0,0,0,0,0
.DA GOBACK,BOOT,0,0,0,0,0,0
.DA 0,0,0,0,0,0,0,0
```

LOAD,SAVE,DIR,FORMAT,DESTRY,GOBACK and BOOT are labels and say where all those routines are located in memory.

Okay, and here are both routines (CHOOSE and WCHOOSE). Those routines were published in ATARImagazin 11/88 and were written by Andreas Binner and Harald Schoenfeld.
The same is to say about most of the other info in this text.
But they wrote it to be public so I hope there is no problem in reprinting it.

```
CHOOSE LDA XARR
LSR
STA XPOS
LDA YARR
LSR
LSR
LSR
STA YPOS
LDA DTAB
TAX
LDY #0
LOOP1 LDA DTAB+1,Y
CMP XPOS
BCS NOTHING
LDA DTAB+2,Y
CMP XPOS
BCC NOTHING
JMP FOUND
NOTHING INY
INY
DEX
BNE LOOP1
CLOSE JSR PULLUP
BACK RTS
FOUND LDA YPOS

ADC #1
LDY #1
JSR PULLDOWN
LDA STORE
```

```
TAY
LDA TXTAB,Y
PHA
LDA TXTAB+2,Y
TAX
LDA TXTAB+1,Y
TAY
LDA #1
STA XPOS
STA YPOS
PLA
JSR PRINT
RTS
```

This routine looks if there you chose an entry in the menu line and opens it.
Please email me for further explanation.

```
WCHOOSE LDA COLL
BNE INPDW
LDA YARR
LSR
LSR
LSR
BEQ WCBACK
JSR PULLUP
WCBACK RTS
LDA YARR
LSR
LSR
LSR
CMP PULLY
BEQ WCBACK
BCC WCBACK
SEC
SBC PULLY
SEC
SBC #1
ASL
STA STORE
LDA PULLN
ASL
ASL
ASL
ASL
CLC
ADC STORE
TAY
LDA VECTOR,Y
STA $CB
LDA VECTOR+1,Y
STA $CC
```

JMP ($CB)

This routine looks if you choose an entry of the open PDW and executes the correlated routine.

Here is another short routine (to go back to S.A.M.) :

```
GOBACK JSR PULLUP
LDA #1
STA DIRFL
PLA
PLA
JMP SAM
```

All other routines should end with an RTS command.

I hope this was not too hard to understand...
Questions and suggestions via email to me...

Does anyone know why Atari decided to hide the Atari 800's full expansion port (Take yours apart and be really amazed) inside the Atari 800 rather than leaving it on the outside? It seems like it was a really stupid move on their part...

Scott

just a guess, but it was probably only for internal testing -
not intended to be a real expansion port. Now a question:
anybody use this to make a xl compatible pbi on an 800?
(would xl OS also, wouldn't it?)?

What expansion port? You mean the slots under the grill for the 10K ROM
and RAM cards?

81. Qwk Readers

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-11 05:48:35 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1993Jan11.054835.11603@cs.tulane.edu>
Source record: 108392

With the talk of Qwk readers for the 8bit, I've sent two to the archive, PabQwk 1.1 and QwkSilver 0.2 Beta.

PabQwk Ver 1.1:

Written by Pab Sungenis
Written in TurboBasic (Compiled)
ShareWare: $25

Qwk reader for the 8bit system with expanded memory. Version 1.1 now saves its indexes to the disk for faster loading. PabQwk offers an AtariWriter like 80 column display (one uses the shift and arrow keys to move left and right), as well as the ability to translate hi ASCII (ANSI) graphics into compatable AtASCII graphics.
PabQwk allows for the steeling of taglines, both standard and BlueWave style and now offers the ability to dump the current message to your printer. Registered versions allow for the reading of extra files often included in Qwk packets (Newsletters, newfile list and bullitins). PabQwk will run under SDX, MyDos and AtariDos 2.5, but was found to run best under SpartaDos (SDX or 3.2d).
WBUG tested PabQwk 1.1 for 2 weeks on a standard 130xe attached to a 256k mio with a 10meg hard drive running SpartaDos X 4.20. We downloaded Qwk packets from all Major Qwk tossers and have had no troubles. This program does require at least 3 banks of free memory to run and you need to run the configure program to make sure Antic is turned off...PabQwk requires all available memory.

QwkSilver Ver 0.2 Beta:

Written by Bobby Clark
Written in TurboBasic (Compiled)
ShareWare $5

Qwk reader for the 8bit system. QwkSilver can not be run under any version of SpartaDos due to a VBI conflict with QwkSilvers on screen clock display.
QwkSilver displays messages in a standard Atari 40 col screen and does not translate hi Ascii (ANSI) to AtACII graphics. QwkSilver saves it indexes to disk for faster booting as well as converting the CONTROL.DAT file for its own use. Features of QwkSilver include, the ability to page forward and backward, dump messages to printer or disk, will display extra files included in QWK packet provided they are listed in CONTROL.DAT (normaly WELCOME, NewFile, BLT-x and GOODBYE), view only message titles (5 at a time) and choose only the message lines you want to quote. QwkSilver does send out a nonstandard BlueWave style tagline.
WBUG tested QwkSilver 0.2 Beta for three weeks on a stock 130xe running

AtariDos 2.5 on two 1050 drives. We downloaded Qwk packets from all major Qwk tossers and have only had problems with packets generated using the JetMail door for SpitFire.

As always, if you are unable to get these files from the archive, just drop me a note e-mail and I'll send you a copy.

From: jjmcwill@mtu.edu
Message-ID: <1993Jan11.080608.4011@mtu.edu>
Source record: 108394

Okay, now that there are two QWK readers out there, what in whe world
are these used for? I gather frm bits and pieces that there are some
BBS systems out there that allow downloading of e=mail, and offline
reading, and then responding to these messages, the new mail then
being uploaded back to the BBS system, thus saving online time and money.
Okay, so what BBS systems use this? Does anyone have a list that would be
of particular interest to us 8 bit users?
Are there QWK supporting BBSes that are also linked to the Internet,
allowing sending/receiving of Internet e-mail and possibly access to
USENET groups such as comp.sys.atari.8bit?

I'm an enquiring mind, and I guess i want to know.

83. Atari XL as Car Computer

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-11 16:06:01 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.726768361@garbod26>
Source record: 108395

I've been thinking of putting an Atari XL computer in my car with a portable TV (LCD colour display type) installed on the dashboard.

With this equipment in the car it would be possible to have many important messages such as "low on fuel", "door not properly closed", "fasten seat belts" etc available with flashy graphics. Not that this would make it any better, replacing the car's own simple but reliable indicators wouldn't improve anything, but a computer in the car would be pretty cool.

I believe that the XL computer only needs a +5V power source, and I could use an 8 KB EPROM for the software (written in assembler).

Has anyone tried this or a similar project? I've heard that computers tend to lock up quite often when used in cars, because of bad glitches in the power source. (If supplied with an adapter from the car battery voltage.)

Btw, there's a 12V battery in this car, I assume a 12V-to-5V adapter is relatively cheap.

Thanks for any information,
Anders Skelander

84. patched as6502 on archive (was Re: Kermit-65 source code)

Newsgroup: comp.sys.atari.8bit

>> assembler listing, both with program source, or just with assembled byte
>> values given in ASCII text. This program is able to run on a "Kernighan
>> and Ritchie" C compiler. Unfortunately, the program that accompanies the
>> assembler, that is supposed to turn the text characters into binary
>> code, is written in ANSI C, and the file calls make the K&R C compiler I
>> am using do strange things. <* ARG! *> Why can't this assembler generate
>> UUENCODE output as an option? Why do people --DO-- things like this? Why
>> do they add non-compatible ANSI C programs to programs that are K&R C
>> compliant? This is driving me crazy!

well, I decided to fix as6502 to output the object file
in atari format. I just put it up on the archive,
in 8bit\New\as6502_atari.tar.Z (use uncompress then tar xf
on unix to unarchive). I included a msdos exe.

I'm thinking about hacking it a bit more - to make it more
like MAC65 - would there be any interest in this? Probably
won't have time though.

Source record: 108399

You could also FTP to the Sparc machine, use mtools on the Sparc to write a 3.5" floppy in MS-DOS format, then carry that floppy to a PC that had a 3.5" floppy AND a 360K (?) 5.25" floppy drive and use UTIL.EXE on the PC to copy the files from the 3.5" floppy-in-MSDOS-format to the 5.25" floppy in double-density AtariDOS / MyDOS format... That's a lot of specialized pieces, but if you can get 'em all in the same place at the same time, data throughput is higher than UUencoding and null-modeming...

Just my $.02

94. Re: Qwk Readers

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-12 13:26:31 UTC
From: winston@merk.com
Message-ID: <C0qtC8.LME@merk.com>
Source record: 108308

The purpose of ".QWK" message readers are to capture a message base. Well, that is not entirely true. A ".QWK" packet is the product of an offline mailer on IBM bulletin boards called Qwik-Mail. Normally, if you wanted to grab an entire message base, you would have to do a "continuous display" of messages while in a message area. The only problem with this is that it is a waste of bandwidth to only send a single character per byte, as any user of SUPER-ARC will tell you. Why not capture the message area in a pre-compressed state? The length of your long distance telephone call will be shorter, as you will be sending multiple characters per byte. About the time that this idea was running around IBM boards, PC-BOARD host software got the idea of archiving all of the mail in a particular conference / message base, and allowing you to download the entire message base as an .ARC file. Then, someone asked themselves, "Why bother logging onto the BBS and dancing through all of those logon / welcome bulletins, menus, and message area changes? Why not have all of that overhead archived and stuffed into the offline mailer packet so you don't have to waste all of this time moving back and forth from one area to another, from one menu to another? Ta-Da! We now have the modern IBM offline mail reader. Essentially, everything is stuffed into a mailer packet archive and fed to you without you having to waltz around online. You can do all of your reading offline, at your own leisure. The funny thing about it was that this major "breakthrough development" of the offline message reader that was put into practice on IBM BBSes in the 1990's had been in use for years on CP/M BBSes such as CITADEL before the first IBM had even rolled off of the assembly line! It only took IBM people a decade to discover this "new" concept!

QWK-Mail offline message readers are mainly used to retrieve mail packets off of IBM BBS systems that carry the FidoNET "Atari" National Echomail Message Base (as opposed to the "Atari ST" Echomail Base). Such systems are: PCBOARD, MAXIMUS, OPUS, TBBS, possibly TELEGARD (if the Blue-Wave offline message reader is ".QWK" compatible. I don't remember...), FIDO v12. There are ".QWK" offline message readers for many IBM BBS hosts.

I have failed to get either PABQWK or QWK-SILVER to work on my stock ATARI 800XL yet (I'm not sure that it is even possible), but when playing with QWK-Silver I made an interesting discovery, namely the ".QWK" message structure for the database appears to be an --ASCII-- format... with high-ASCII characters used as special characters and delimeters. Thus, it should be entirely possible to write a ".QWK" message packet reader using TEXTPRO macros, for example! Of course, the real trick would be in being able to create a "reply" packet via TEXTPRO that a QWK-Mailer would accept as a valid format. I don't think it would be difficult if anyone wanted to try it. The ".QWK" message structure looks fairly straightforward. The

QWK-SILVER doc.s come with a description of the QWK message packet structure. If anyone has a stock ATARI 800XL and is running QWK-SILVER successfully, please post your configuration information so that I can try and duplicate your setup. Thank you.

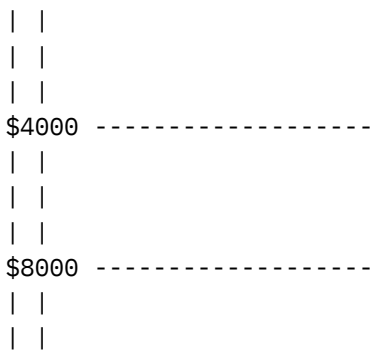
How the XE's do banking.

In the 130XE, there and all the XL/XE series, there is a register
located at $D301 which is part of the internal Peripheral Interface
Adapter chip. This register is 8 bits wide, and on the 130XE, the
bits are laid out as follows:

0 BASIC ROM enable
1 OS ROM enable
2 XE bank bit
3 CPU bank enable
4 ANTIC bank enable
5 XE bank bit
6 unused
7 diagnostic ROM enable

Well, that's the gist of it anyway, I might have got the bit numbers wrong,
but the labels are pretty much correct.

The Atari memory map can be divided into four chunks, labelled like this:



```
| |
$C000 -------------------
| |
| |
| |
$FFFF -------------------
```

That's the 64K memory space of the 6502 chip.

When divided into 4 pieces, each piece is 16K in length.
The banked RAM, of which there is another 64K of this in the 130XE,
is also divided into 4 pieces, each 16K in length.

When you set, say, bit 3 high, the CPU will now see banked memory.
Where does the CPU see it? The area of main RAM, between $4000 and
$8000 gets swapped out, and one of the banks gets swapped in.
Thus, any reads or writes to the $4000 to $7FFF area now writes to
BANKED RAM, and doesn't touch the main memory.
You tell which of the 4 banks are available in this memory "WINDOW"
by the values of bits 5 and 2.

So, it you could number the banks like this:

bit 5 bit 2 bank number

0 0 0
0 1 1
1 0 2
1 1 3

ANTIC BANKING

There is another microprocessor inside your Atari, besides the main CPU,
called the 6502. The other processor is called the Antic chip.
Antic is contstantly telling the 6502 to stop what it's doing, so that
the Antic can take over the computer, and handle the graphics display.
That's what Antic is designed for, graphics. The Antic has its own
programming language, and a program written in it is called the display list.
A display list tells the Antic CPU what sort of graphics mode is to be
displayed on the screen, and where in memory the screen data is to be found.

What if you did the following?

Set the banking bits, #s 5 and 2, to zero, to access bank zero.
Set bit 3 to 1, allowing the CPU to see the banked RAM.
load a graphics 8 picture into the $4000-$7FFF area.
clear bit 3 (set it to 0), and set bit 4, allowing the Antic to see the
bank. Now tell Antic's to look for display data at $4000, and
that it's a graphics 8 mode.

What have you done? Well, now, Antic sees the picture that is stored in
BANKED RAM, but the CPU which looks in the same area, still sees main RAM!
That's one of the things I think is really neat about 130XE banking.
Usually, a graphics 8 screen consumes 8K of memory. In a computer

without extended RAM, like a stock 65XE, if you set up a graphics 8
display for a game or an application or something, that's 8K less room
you have to store your program.
With the 130XE, you could "hide" the 8K of display in a bank of extended
memory, and thus freeing 8K of memory in main memory to store your program
code. Of course, when you want to make changes to the display, you would
have to allow the CPU to see the memory bank as well, modify the display
data, and then switch off the CPU bank enable.

Concersely, you could do the just opposite, and have only the CPU see banked
RAM, and the Antic sees main RAM. That way you could load in an extra 64K
of code, in modules each 16k long, and as your program needs to access
the different modules, you would just switch in the appropriate bank.

How is this possible? Because the extended RAM circuitry knows how to
differentiate between when the Antic is in control of the computer, and
when the 6502 CPU is in control. Depending on which is in control,
and trying to read/write to the $4000-$7FFF area, the extended memory
controller can look at the settings of $D301, and allow the CPU or Antic
chip "see" the RAM they are supposed to see.

How is a 256K upgrade set up? Look again at the table just below.

0 BASIC ROM enable
1 OS ROM enable
2 XE bank bit
3 CPU bank enable
4 ANTIC bank enable
5 XE bank bit
6 unused
7 diagnostic ROM enable

And now we'll modify it so it looks like this.

1 OS ROM enable
2 XE bank bit
3 CPU bank enable
4 bank bit
5 XE bank bit
6 bank bit
7 diagnostic ROM enable

As you see, bit 4 is no longer an Antic enable bit, it's used for
banking. Likewise, bit 6, which was previously unused, it now used for
banking as well.

This gives you 2^4, or 16 possible banks. Of those, only 12 are used
in a 256K upgrade, giving 192K of banked RAM available.
Well, what happens to the Antic access to banked RAM.
Well, depending on which 256K upgrade you've done, on some, Antic will
always see just main memory, it will never see banked RAM.
On others, if the CPU sees banked RAM, then so does the Antic chip.
This can be somewhat limiting, but it's about the only way to

make bigger memory modifications, without say, disabling the BASIC
ROM enable bit, and using it as a banking bit instead.
320K upgrades actually use all 16 possible combinations of the 4
banking bits... anything beyond that will start using bit 0
and maybe even bit 7. The Newell 1088K memory upgrade disables
BASIC on/off switching, and uses bit 0 for banking. It also
uses bit 7. When bit 3 is set, bit 7 is a banking bit.
WHen bit 3 is clear, bit 7 is a diagnositic ROM enable bit.

Well, I hope that helps you to understand a little more about memory
banking. I think I've covered everything, and haven't made any
mistakes. If I have, I'm sure somebody will point them out in a following
post. :)

As far as 65XE upgrades go, I think Innovative Concepts might have
one. I'm not sure they're still in business though, and I don't have
the address handy.

question: is it alright to leave an atari 800 on all the time?

the reason i'm asking is that i'm going to be using an atari 800
in an art piece to be displayed in a gallery situation. The piece
will be up for one month. ideally, i'd like to be able to leave the
atari and monitor on all the time... no shut-downs at all for the month.
is this prudent? will i screw the computer? crash it? cause a fire?

PLEASE! if you know about this stuff, Email me... jt2n@andrew.cmu.edu
the opening is friday.... i gotta know soon!
Thank you!

There was an article in Antic or Analog several years ago about a police agency that did just that with 800XLs. Can't recall where or to what extent they did it (or why) but I do recall a picture of the inside of the car with the computer and a monitor.

As an aside, it's illegal in most states to operate a television in the front seat. I don't think the cops are going to make a distinction between tv and your use as a monitor. They'd probably consider it a hazard to driving. Proceed at your own risk.

104. Help fix the Info-Atari8/16 Digests

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-12 22:43:05 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1ivhhpINNoik@usenet.INS.CWRU.Edu>
Source record: 108314
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

As many of you should already know, Usenet's comp.sys.atari.8bit and comp.sys.atari.st have alternate identities as the Internet mailing-lists Info-Atari8 Digest and Info-Atari16 Digest. Every posting on the Usenet side appears on the Internet side. Problem: Any posting sent to the Internet mail-list is NOT cross-posted to the Usenet side.

John Dunning, jrd@stony-brook.scrc.symbolics.com, and maintainer of the Info-Atari8/16 Digests, would like to fix the digestifer software to cross-post in both directions. The following is from him:

>
[The digestifier is] a C program and a bunch of shell scripts. Most of the interesting work is done in the program, the shell scripts are mostly there to decide when to run the program, and shovel things from the news directories into mail format, which the digestifier wants. There are a couple of stupid little programs that I wrote to aid in the process.

There are two big problems in all this: When news messages are received, they need to be sent through something that will mail them to the digestifier program. That happens completely parasitically now, and it's a kludge. The other thing that's necessary (which I've never been able to figure out how to do) is to go the other way, ie mail received *from outside* for the digestifier gets sent to the news sender. You need to be careful in a couple of places to prevent loops.

If you can scare up some folks who know enough about this kind thing to get it working, I (and the rest of the list, I suspect) will be eternally grateful.
>
End quoting from John Dunning.

Again, contact jrd@stony-brook.scrc.symbolics.com if you can help. I would imagine the participants of comp.sys.atari.8bit, comp.sys.atari.st, the Info-Atari8 Digest and the Info-Atari16 Digest would be very grateful indeed.

Message-ID: <1993Jan12.233653.1072@cs.tulane.edu>
Source record: 108315

Almost every major IBM BBS system supprots some form of offline reading. There are two major types, MegaPackets (used with the MegaMail offline reader) and QWK packets. QWK's seem to have become the defacto standard for the off line reader in the IBM world. I have not loged on to a major or for that matter, many minor systems that didn't have Qwk's available.

To run either PabQwk or QwkSilver, you need 128k of memory or better, neither will run on stock 800xl systems. At this time, QwkSilver will not run under any form of SpartaDos as there is a VBI conflict in it's on screen timer. I have spoken to Bobby Clark about this and it looks like he may be planing to the Time$ function in TurboBasic for the next release.

I've use both programs to read packets for FidoNet, WWIVnet, Fnet (through ZnetOnline) and Rime. I've used packets from all major Qwk tossers, SFQwk (SpitFire), JetMail (SpitFire), Qmal4 (PcBoard), Maxis (ST), and Synchronet. All arc'd packets unarced with Bob Puff's SuperUnarc have worked just fine.

If there is anything I can do to help anyone get started with these programs, let me know. I talk to both authors from time to time, so can pass on any ideas, problems, and addition.

JM> Okay, so what BBS systems use this? Does anyone have a list that would be
JM> of particular interest to us 8 bit users?

There are two QWK mail readers, PabQwk (v1.1?) and QwkSilver(v.2b). The
QWK mail door was originally developed on IBM BBS'es, but it is also used
on others (ST's, Mac's, etc.). You are only limited by storage space as to how
many messages you can receive, read and reply to offline.

JM> Are there QWK supporting BBSes that are also linked to the Internet,
JM> allowing sending/receiving of Internet e-mail and possibly access to
JM> USENET groups such as comp.sys.atari.8bit?

I am currently on an IBM Fidonet board reading this Usenet group. I also
have access to Internet e-mail. The only thing I wish I had access to is ftp!
Lot quicker than the BART mailer! :)

I almost agree with them, it could be a hazard to driving even if the
screen won't display anything but helpful graphic symbols in colour. I
could well end up looking at the screen every now and then just to see
if there's a bug in the software or anything.

Perhaps I should stick to sound, but then an 8-bit Atari with an simple
8K or 16K cartridge just isn't good enough. I would need synthesized
speech.

>diskettes (from the infamous 104xxx 1050)?
>2/
>2. What sort of incompatibilities exist between the Atari 800 and
>the Atari 800XL?

Forward incompatibilities:

some vectors in the Operating System have been changed, and the BASIC ROM
is now inside the computer as a ROM chip, instead of as a cartridge.
Due to the Operating system changes, some software that made "Illegal"
calls directly to OS routines to save time don't work properly.
Fixing this usually involves just running a translator disk, or using
a OS ROM replacement/enhancement that has a translator built in.
These include the Ultraspeed + OS, the Omniview 256 and the Omnimon XL.

Backward incompatability:

The 800XL allows you to disable the Os ROM, and thus reveal the RAM
underneath. DOS systems like SpartaDOS 3.2d, and TurboBASIC XL
both use this room to store some of their code. These programs will
not work on an 800. The 800XL has a Parallel Bus Interface (PBI)
and allows you to connect some very powerful devices, like the
CSS Black Box, and ICD's now hard to find MIO box, and the KPI interface.
The 800XL allows XE type extended memory support, where memory appears
at $4000-$7FFF, with the banking being done at $D301.
THe 800's use Axlon compatible banking... don't know the specifics, but
they are different.
Also see OS vector differences above, the same would apply in reverse.
the Quick compiler from Power Per Post uses some direct OS calls in the
800XL OS, so this won't work on the 800.

I'm looking for two Atari 8-bit computers in working condition, with or without peripherals (i.e. tape drive, disk drive, etc.) Preferably working, but I *may* be interested in broken ones, especially if they're fixable and you know what's wrong. A broken Atari 130XE would also be considered.

Software is not necessary, but if you have some neat stuff you want to get rid of cheap, I might be interested in that as well.

Please reply to chad.beeder@m.cc.utah.edu. Thanks in advance.

Well, once again there was an article in Antic (I think) about hooking up one
of the General Instruments speech chips to your joystick ports. The chip
came from Radio Shack. But then, how would you get input on the system?
You could hang a 6821 off the XL buss. The old MPP Corp. made an
expansion card with a 6821 (or 6522 or something like that) so
you could play with the port.

Wouldn't it be easier to buy a new car? <g> Or build a microcontroller?

Due to the poor weather today, our meeting has been rescheduled.

In January, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Calendar programs.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the December issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Meeting starts at 2:00 pm.

Saturday, January 16, 1992
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

117. Antic, RAMbo and DMA.

I was reading an old review of the Newell and RAMbo 256k XL upgrades and I realized that I may have created a problem for myself. I originally installed a RAMbo upgrade in my XL many years ago but since everything on my mother-board was soldered (a newer machine) I later traded a friend for his 100% socketed Mother-board. (He had no plans on expanding). When I transferred my RAMbo to my new board I simply reinstalled it wire per wire (I have lost the Docs). Anyway, that review mentioned that wires needed to be connected in certain ways depending on what ANTIC you own.

Could somebody please tell me what the differences are in connections for the different models of ANTIC. I want to be sure I have it connected correctly. (It now seems to lock sometimes if toggle DMA during disk access.)

Thanks,
-Adam Conover.

I have just recently downloaded CC65 from the archives and I was wondering if anyone had any 'real' documentation for it. The only thing that I could find was a description of the command line switches and a file on the library functions. Is there any documentation on the compiler itself? (like Structures? Unions? Data Types? etc.). I heard that CC65 was a 'Small C' package. Does it conform completely to the 'Small C' standard and is there any good 'Small C' reference material available? I have heard that cc65 is about the best available.

Does anyone have any familiarity with 'LightSpeed C'? How is it???

Another thing... What is the best PASCAL compiler available for the Atari. I have only ever used Draper Pascal (and disliked it). I have heard about Kyan Pascal and CLSN Pascal. Basically, I want something close to ANSI (or ISO) Pascal if that is possible.

Any help would be greatly appreciated....

-Adam Conover.

I'm pretty sure it shouldn't be any trouble. I don't have an 800
however, but my 1200xl is on about 70% of the time (it's my alarm clock
at night, and now that I have a RAMdisk, I like to keep it on :) ...
perhaps two switches, one for extra RAM and one for the rest of the
system would be useful here.. I'd have to ask Bob Woolley (or some other
great 1200xl hacker) about it...)

Anyways.. just be sure it's well ventilated... (wondering why MY SMALL
(7'x7'!) room is always so WARM!)

also..give some details on this little project! We're all interested,
I'm sure! Hey, way back when it'd be the beginnings of a magazine
article..

perhaps it will be in _AC_... (hint hint!)

I don't think a Percom can, but some double density drives can, like an
Atari XF551.

If I remember right, the difference between the two different Antic chips is that the older version only had a 7-bit refresh counter, while 256K ram chips need 8-bit refresh. I don't have the part numbers of the different Antics here, but they should be in any text file describing a do-it-yourself ram upgrade. If you have the older chip, I think you have to add another chip to the circuit, or you can get a new Antic from the usual mail order sources.

I'm one of the programmers of SAM, and I'm speaking for PPP (the
publisher).

Has anybody tested SAM on NTSC-computers in the US and/or on the
1200XL?

If have heard, that there could be problems but I'm not sure on
which computers they could appear. Probably it's the old 1200XL-problem
that appeard with QUICK, too.

So please tell me, if something went wrong with SAM.

Sure. You can leave your 800 on 24 hours for a month. I run a BBS and my
130xe hasnt been shut off for well over 3 years. The main damage to
computers comes from cycling the power on and off.

You may end up burning up your monitor, though - specifically if the
auto-screen saver mode isnt kicked in..

No. A Percomm can't read enhanced (dual) density disks. Its clearly
SINGLE or DOUBLE density only.

As far as differences between the 800 and 800xl - there are many.
Memory, memory locations, colors, sounds, etc..

The main limitation would have to be the memory differences, though.

I received the following response from John Dunning regarding the recent problems with UCBVAX:

From: INET::"jrd@STONY-BROOK.SCRC.Symbolics.COM" 14-JAN-1993 12:04:17.07
To: phvax::poehland
CC: jrd@STONY-BROOK.SCRC.Symbolics.COM
Subj: CSA8-IA8 Cross-Posting

Date: Tue, 12 Jan 1993 19:10 EST
From: poehland%phvax.dnet@smithkline.com

Howdy John,

Any hope of our being able to freely cross-post between the newsgroup & the Digest? The header on the Digest has been promising it for several years but nothing ever happened.

Yah, I know. I should have changed the header when I gave up trying to figure it out. The problem is that the host that does the digestification is a unix, and that makes everything 10 times harder to figure out than it needs to be. I tried and failed to put together a program that would implement cross-posting, and have never had any success at finding anyone knowledable enough about unix to help.

The good news is that what with ucbvax being turned off, several people are interested in this, so we might actually get some help and get it working.

Needless to say, if you know any unix wizards, and could enlist their aid, we'd be very appreciative!

So, anybody out there who's into UNIX, please contact John Dunning! No telling how long it will be before cs.utexas starts cutting people off.

Meanwhile, a hearty round of thanks to Bill Marcum for finding us a new site!

Yeah, well radio shack doesn't have a lot of things anymore. But
you should be able to get the part from other suppliers (Mouser
or Jameco maybe).

It's an ok speech chip as things go. I used it and my atari in
an installation at a live art show many years ago - after about
an hour or so it wouldn't talk any more - had to reset the computer.
But then again, it was talking constantly throughout the show.

Who knows?

Somebody mentioned they are having trouble with their 1050. When the drive motor comes on but doesn't go off again, it is almost certainly the Floppy Disk Controller (FDC) chip which has gone. Try and get hold of a replacement chip (from ATV or somewhere) and simply plug the new chip in. One of my 1050s went like this, and it was the FDC chip.

Your 1050 needs to go to a service center for repair.

>Also, how do I hook up standard RS232-type peripherals to it? I've got a
>modem I want to use.............I think there's some kind of interface?

The older Atari machines do not have RS232 ports built in. The "Serial I/O"
cable is NOT what you would consider "standard" serial. You'll need to
get your hands on the Atari 850 interface (or equivalent... MIO or BlackBox
come to mind) in order to hook up your modem.

140. 8-bit -> 4-bit digitized samples/ASSS

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-16 07:58:35 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <comgXB3w165w@cyberden.sf.ca.us>
Source record: 108352

Has anyone used the program ASSS? (Atari Sampled Sound System)...

I have it and it seems an ok program, but it just LOVES to crash and do very strange things while converting 8-bit sounds (from other systems) into 4-bit sounds (for the Atari)... So... I started working on my own program to do it (in TurboBASIC XL... If it ever WORKS, I'll get it into Action!) Anyways... here's how it works:

the ASSC.EXE (converter) program takes a sound file (for example, BOUNCY.IFF, the file included) and changes it from 8-bit resolution sound to 4-bit (which the Atari's POKEY handles)... as I said, it seems to die on me (at different places) and tends to piss me off a lot. It COULD be that I'm using MyDOS rather than DOS 2.5, but other than the 192k RAMDIsk, I've got nothing funky loaded up.. (you should see what it does with Hyper E: v.2 installed! jeezus!)

well.. I thought "great! this should be a simple task!" (converting 8-bit to 4-bit.. the ASSC.EXE program ends up producing a file half as big as the original 8-bit one)

I figured this: load up two bytes from the original file, and put only one of them into the new file...

nope.. ok.. dumb idea..

then I started doing stuff like this:
take the low nybbles of two bytes and add them together... like this:

01011010
00110101

to become this:

(01011010 gets the last 4: 1010
00110101 gets the last 4: 0101
)

10100101 ...

I've also tried it by taking the low nybble of the first byte and the high of the second, or every other byte of each... like this:

ABCDEFGH (using alphabetcial labels..)

ACEG (and adding the "ACEG" of the next byte to the low...and high even...nybble)

but nothing seems to work... the closest I've gotten to was the above (something like it at least)

I believe the code went like this:

LO=first byte
HI=second byte (in a pair)

DUH=LO&15+HI&240 (&=bitwise "and" operand, DUH is the output variable)

I can hear what the sound is supposed to be like, but I get a really
high-pitched squeal over it..

so... can anyone tell me EXACTLY what the difference is between the 8-bit
and 4-bit sounds? what bits am I to extract from the original file to
make the new file come out right? it's probably something totally simple
that I overlooked, knowing my damned luck lately (grrr)... but hey,
that's what this plethora (you folks) of information is for! :->

thanx a ton! (can't believe you read this far!!!)
confused,

143. [--- QWKSILVR 0.2b Bug ---]

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-17 13:58:14 UTC
From: winston@merk.com
Message-ID: <C10453.86@merk.com>
Source record: 108455

Well, everyone can revise their "QWKSILVR 0.2b will not run on a stock ATARI 800XL....". I just got QWK-Silver 0.2b to run on a stock ATARI 800XL. The problem is that the QWK-Silver 0.2b configuration menu does not control QWK-Silver 0.2b's behaviour. Another problem is that the disk drive activity on the SIO daisy-chain is not tested for. Whatever the actual configuration of drives and devices you have attached, they are irrelevant. A drive device search path of "D1:", followed by "D2:" is --HARDCODED-- into the compiled QWKSILVR source code. You have to reconfigure your floppy drive configuration so that there is a "D1:", and "D2:" installed, and ignore all of the QWKSILVR 0.2b setup configuration menus. (If you don't --OWN-- a "D2:" drive, it may be possible to dive into the compiled code with a sector editor and change all of the references to "D2:" into references to "D1:". NOTE: You can't use the stock ATARI 800XL RAMDISK under the OS space, as TURBO BASIC is using this space to run the QWKSILVR 0.2b program, so the option of using a RAM disk for your second search drive is impractical.) A possibility for using a ".QWK" offline reader on a stock ATARI 400/800/1200XL might be to write a TEXTPRO macro to translate the ".QWK" message structure. Such a TEXTPRO ".QWK" message reader could be run universally on all ATARI 6502 8-BIT equipment.

>] I've been thinking of putting an Atari XL computer in my car with a
>]portable TV (LCD colour display type) installed on the dashboard.

Sorry I missed the original posting, but I've done this. The 800XL
works fairly well in a car. Build your own 12VDC to 5VDC power supply
for the CPU, and find a monitor that works on 12VDC (mine is
monochrome). The worst problem I had was powering the 1050 disk
drive, which will actually work with 12VDC power, except that it's
hard to get the computer to boot reliably.

My monitor has no TV tuner, so it does not violate the "no TV visible
to the driver" laws. The couple of times I've been pulled over with
it installed the cops were curious, but were much more concerned with
how fast I had been driving.

The parallel bus interface makes it easy to build an external device
to interface with the car. Mine has a 16-bit counter connected to the
speedometer cable. I wrote an Action! program that samples the
counter every second and displays time, speed, and distance
information. Unfortunately, the 800XL CPU doesn't have the processing
power to do all of the calculations I'd like: it spends almost the
entire second between samples doing calculations and updating the
(graphics 0) display.

Hi !

I have all the Zmag issues which atari.archive (and the wuarchive mirror)
has. Has anyone an idea where to find other issues than those.
I have internet access (read news,ftp). Don't bomb me with issues via
email. If you think you have some of the Zmags I'm waiting for, please
send me a note which issue and I will tell you whether you should send
it or not.

Thank you !

I have an old atari 800 with omniron board for sale. It has no drives
cartridges or anything else. Anyone interested? Im open to offers.
I also have an atari 2600 with keypads, paddles and some cartridges for sale.
The cartridges are as follows.
Bezerk
Asteroids
Pitfall
Warlords
Stampede
Adventure
Chopper Command
Human Cannonball
Space Invaders
Laser Blast
Maze Craze
Championship Soccer
Superman
Freeway
Basic Programming (with the keypads and th templates)
Circus Atari

Please mail me at

Hi all....

Could somebody briefly explain to me the file header of a binary file?

I know that FF FF are the first two bytes. I THINK the next 2 are
SS SS EE EE (ss- start location. ee-end location) but I don't know
about the rest.

What bytes are necessary?
What determines if it runs or returns to DOS?
If you chain (by appending) files together, Which one gets control?

Thanks,
-Adam Conover.

it seems my programming habits go first in-last out...

I took a day off from all other projects to make...

PONG!

of all games... but this one has a twist (as all pongs in the 90s do...) it uses digitized sounds (or the plain old "beep" if you REALLY want it...) and graphics 9 (so far the best mode for digitized real images) screens as backgrounds (or the plain old black background if you want, of course)

I'll upload it to the archive a.s.a.p... along with a bunch of digitized music demos...

btw: Dean Garraghty, I just LOVE "Eve of the War" on your "journey into sound" demo... :)

you should hear my "HPYMNDYS" demo (Happy Mondays)... I'm not even sure of the name of the song I sampled to make the demo with...

I also made a bunch of James Brown demos, ehhehe.... and a Didi7 and a Ren&Stimpy one!

and people think I'm crazy...

I'm really MAD! 8^)

I tried this about two years ago and, yes, it worked (I built a 8-Bit sampler
using the AD7569, an 8bit AD/DA converter). But the quality isn't
worth the effort, because there's too much noise added by Pokey (don't know from
where it comes...) and you have to decrease the sampling rate.
And: you need twice the amount of memory (simply forget about packing four
6-bit-samples in 3 bytes).

My recommendation: stay at 4 bit (two samples per byte).

Digi-Studio -- the new version
------------------------------

What it does, and how I did it!
------------------------------

Article by Dean Garraghty.

On Saturday 14th November 1992 at AMS6 in Stafford I launched the new complete
version of Digi-Studio, my digitized sounds and music system. I have talked
about the old package 1 on a previous News-Disk. The "missing part" of
Digi-Studio was the tune editor. We need some way of creating our own tune
files for playing with digitized sounds. That's what the new version is all
about.

If you don't know, Digi-Studio is a music creation system for digitized
sounds. It is like all the other programs of this nature, BUT Digi-Studio uses
"real" sounds that have been digitized. This includes things such as trumpets,
synths, piano, pan pipes, guitars, pig grunts, bells, and loads of other
things! You can play these live using the computer keyboard as a piano
keyboard, or play tune files using the sounds. You can also edit the samples
using the supplied editor, or create your own using a joystick. You can also
add tunes to your own Basic or Turbo-Basic prgrams and play them using real
sounds!

Originally, the tune editor was going to be sold as "package 2". But, I have
now scrapped the "package" idea and merged all parts of Digi-Studio into one
big package. This contains new updated versions of the Keyboard and Tune
Players from package 1, as well as the Sample Editor and Tune Compiler from
package 1.5. But, it also has the new tune creation system. This allows you to
create your own tunes from sheet music for use with Digi-Studio. For this
purpose, I have created a new language called LIDS (Language for Instructing
Digitized Sound).

LIDS is a new computer language in which you describe sheet music to the
computer. You write your programs and then use the LIDS Compiler to turn them
into tune files for playing in the Digi-Studio system, or even in your own
Basic or Turbo-Basic programs!

LIDS is a very easy language to learn and use. Most of the commands are
derived straight from sheet music. If you can already read music, the LIDS
will take no time at all to learn! If you can't, don't worry. The manual
supplied with Digi-Studio contains an extensive section on how to read music.
This also includes examples of real music along with their LIDS programs. An
example LIDS command could be: A3 C. This in fact describes the note A in
octave 3, played for a crotchet. Sharps and flats are also handled. LIDS also
```

has extra commands to allow you to do some clever things. E.g. it allows repeats like this:

```
RS
A3 C
C3♯ M
B2 Q
A2 Q
RF
```

Also, it has facilities for handling tied notes like this:

```
TS
A3 C
Q
M
TF
```

It also takes care of the time signature. E.g. if the music to be programmed was in 6/8 time, you can issue the command SIG 8 to LIDS and it will take care of it. Also, you can take care of different tempos by use of a command called SPEED. This can speed up or slow down the music.

The LIDS Compiler has a built-in text editor for editing LIDS programs. This means you can also compile straight from memory! The LIDS Compiler also has a feature called "wrap". This allows you to add sustain to long notes.

As I mentioned earlier, the Keyboard and Tune Players have been updated. The Keyboard Player has had a few of its notes altered to play more in tune! Also, an offset option has been added. This is for the benefit on non-UK users who hear notes being played differently due to different clock rates. However, UK users can use it to make some samples sound more in tune. Try -10 to make some samples sound more in tune! The Tune Player also has the offset function in. The Tune Compiler (for allowing you to merge Digi-Studio tunes in your own Basic programs) has also been updated with the offset option. It also allows you to quit the program more easily now.

NOTE: the LIDS compiler is now in version 1.2. This has corrected a problem with pitch representation. All registered users will be sent a copy of v1.2 soon. But, the tunes on the disk should still be played with offset set to -10. Any you create with v1.2 should be set to 0. No copies of version 1.1 were sold in the US, so all US users will get v1.2. Only a hand full of v1.1 got out anyway!

The new complete version of Digi-Studio comes on 2 DS/SD disks and includes a 44 page A4 sized manual. Disk one has the programs and some tunes and samples on. Disk two contains more tunes and samples. In all, 55 samples are provided, and 47 ready-to-play tunes.

The manual is extensive! I know, I wrote it! It is fully typeset and laser printed. It is extremely detailed. Each program within the Digi-Studio system has its own section. The manual also has sections on reading music and programming in the LIDS language. It also has an appendix with examples of

sheet music along with the corresponding LIDS programs. This manual should tell you everything you need to know about Digi-Studio!

Digi-Studio costs 12pounds+1pound P&P in the UK. This includes the 2 disks and manual mentioned. However, it is also available in the US from my distributor. Over there it costs $29.95+$1.50 shipping. In the US it is available from: Lance Tatman, 844 Kern Street, Richmond, CA 94805.

In the UK and non-US countries it is available direct from me:
DEAN GARRAGHTY, 62 THOMSON AVE, BALBY, DONCASTER, DN4 0NU, ENGLAND. Price to EEC countries: 15pounds including shipping. Please contact me for prices to other countries. Please pay in UK funds by IMO or in cash in pounds. Use registered post if sending cash.

That was the what it does part of the article, now what went on behind the scenes!

The Digi-Studio project started way back in the summer of 1990. It was an attempt to create a utility for creating music using digitized sounds. The first bit of the system was launched at AMS5 in November 1991. My previous article explains all about that!

After package 1, I thought it would be a good idea to have a utility to fiddle with the sounds! I remember seeing a similar thing on the Voice Master demo disk, so I thought I'd have a go at writing one for Digi-Studio. I started doing that at christmas 1991. I took until Easter 1992! Writing the Sample Editor was a pain! It has to do lots of odd things with memory, and in Turbo-Basic. The algorithm for reversing sample space is particularly odd! The way samples are stored means that a simple swap all the bytes around will not work, as I found out during testing. Thanks to Mike Blenkiron for spotting that it didn't come close to working! It has to rotate bits within the bytes as well as reverse bytes, which is why it takes so long! Another complication was over "pages". When you edit a Sample Editor page the program has to calculate the actual memory page where it will be. Not as easy as it might sound! The copy page functions were also complicated to write. Moving big chunks of memory around is hard!

Writing the Tune Compiler was fairly straight forward, and it worked pretty much first time!

The absolute "biggy" was the tune creation system. Originally, this was being developed with a nice front end, where you picked notes with a joystick and was all very nice. However, for samples you need that little more control. Something more powerful was needed. In early June 1992, I started scribbling down ideas for a language. After a lot of work, LIDS popped out of the scribble about a month later! This was to be an easy to use language to allow you to create tunes for playing using samples. It looked good on paper, but I needed to write a compiler for it! It took a week to get a very basic compiler working. This had no repeats, ties, speed, or any other flashy techniques! It was primitive, but it worked! It didn't do much though. It didn't do anything clever with the samples to make high notes play the same speed as lower notes. This was the next step. The compiler now did all this while it was turning

LIDS programs into tune files.

I soon realised that there was no easy way to type and edit programs. So, I got to work on a text editor. This is a very simple line editor, with all the usual delete, edit, insert, list, append, list, functions. Writing this was a PAIN! It is all wacky string handling like you've never seen it before! It took 3 weeks to get a working version. I then thought it would be nice to have this within the compiler. An idea I put on ice until I'd finished the compiler!

I now got back to work on the compiler. I needed to add repeats which I did. I then thought about tied notes, and designed a way of handling those which went nicely into the compiler. I then added the SPEED command for handling tempo. This was quite easy really. Then I decided to tackle the problem of different time signatures. Not an easy one this! I added a command called SIG which attempts to handle time signatures with no work on the programmers part! It's not always 100% successful though!

While writing the compiler, I was also refining some of my ideas about Digi-Studio, so I had to keep trying lots of tunes out to get as much "test data" as possible to try them out as I went along. It was quite difficult to get the timings working properly!

After finishing the compiler, it was time to merge the text editor into it! CRASH! Everything failed to work. There were memory problems (the program and its storage needs about 23K), and loads of conflicts with variables. Also, some line numbers went all odd when they were re-numbered, so some sections of code simply refused to work like they did before!! Very odd, but then Turbo-Basic isn't bug free! It took one heck of a lot of hard work, late nights, and sweat to get it working! I was still de-bugging it just a few days before release! I'm not 100% sure it is totally bug free. That's why I offer free (well, you have to pay for disk and postage!) updates to LIDS. Hopefully, I will add in more features and get rid of any bugs that come to light. Don't let this put you off buying Digi-Studio! LIDS works perfectly well, and I'm sure any bugs that do come to light will be very minor ones!

This time, I was writing the manual at the same time as writing the software. In fact, I started writing some sections of the manual before I started the software (an old IBM technique, well known in the world of professional software engineering! Just thought I'd try it on the 'ol 8-bit!). The manual started getting longer and longer. It ended up at 37 pages of text, and 7 pages of appendices. And that's 37 pages of densely packed 11 point text, none of this big gaps and 10 lines to a page like the Atari manuals of old!! This manual is a wapper! It took me 1 1/2 hours just to read it, and over a week to spot the typos! The section on reading music was difficult to write. Although I am a formally trained musician (with several qualifications in music), it would be difficult to explain some odd terms and ideas to the man on the street! So, it was down to the library to get some books on the subject! The book I found useful, and which I would reccommend you have a look at, is "Music in the classroom" by B. Rainbow. ISBN: 0-435-81746-9. I would particularly refer you to chapter 4. Also, "A new dictionary of music" by A. Jacobs is also a useful reference if you want to know more! Appendix C of the manual is where all the actual music examples are, so these were cut and

pasted with manuscript paper. Appendix D contains some actual music along with the corresponding LIDS programs. I thought this would be a useful addition to clarify some of the things I talk about in the Reading Music section of the manual.

One thing people moaned about with the manuals for packages 1 and 1.5, was that the text was hard to read. That's because they were reduced to A5 size. So, I decided to produce this manual as a full A4 sized manual with a plastic spine to hold the sheets together. This can easily be removed so you can put the manual in a ring binder if you like.

So, what's next for Digi-Studio? Well, the thing I'd really like to have a crack at is a 3-D landscaper for sound. This is done on some VERY expensive synths. This is where you define a start and end page of a sample space, and the computer fills in the rest of the sample space by slowly tending the start page towards the end page. The graphical representation of this looks like a 3-D landscape. However, with only 4-bit playback resolution, you wouldn't get much of a landscape!! It's worth a try though!

Writing Digi-Studio was a task and a half! Two years work involving me and lots of other people along the way! I have already set up a dealership for it in the US, and nearly have one in Germany. It would be very nice if more people were using Digi-Studio! It's still a VERY minority piece of software at present. Go on, give it a try!!

Adam,

you write:
> Could somebody briefly explain to me the file header of a binary file?
>
> I know that FF FF are the first two bytes. I THINK the next 2 are
> SS SS EE EE (ss- start location. ee-end location) but I don't know
> about the rest.

Yes, you are right. The first FF FF bytes tell the DOS that the following
file should be handled as a binary file. If you replace the FF FF bytes
your DOS says the file isn't a binary and it stops loading.

You are right about the following bytes too.
SS SS is the start location (LO HI order), EE EE is the end location.

Example: FF FF 00 06 03 06 32 35 32 3E

With this file above, the DOS would load 4 bytes, i.e. $32,$35,$32,$3E
into the memory area $0600-$0603. When you specify less then 4 bytes
after the haeder you'll get an error.
If you chain files, the next file header is just appended to
the file.

Let's go on with our example:
FF FF 00 06 03 06 32 35 32 3E FF FF 00 80 01 80 AA 45

What happens now? The same as above, except that aditionnaly
the bytes $AA and $45 will be loaded into the memory area $8000-$8001
You could ommit the FF FF bytes from the chained part of the file:

FF FF 00 06 03 06 32 35 32 3E 00 80 01 80 AA 45
This file behaves like the above and it's shorter.

You could go on with chaining until your diskspace runs out.

> What determines if it runs or returns to DOS?

In order to automatically run a program you should specify a
starting address. This starting address is stored into the
memory locations $02E0-$02E1. An initiation address should be
written into $02E2-$02E3 (it could be vice versa, I don't have my
notes with me).

But how to store it? Very simple. Just chain the addresses to your
file.

Let's see what our example can do for us:

```
FF FF 00 06 03 06 32 35 32 3E 00 80 01 80 AA 44 0E 02 1E 02 77 E4
```

The only thing that has changed is that now DOS jumps into
$E477 upon loading. Not very usefull in our case, but you
could specify any other address.

> If you chain (by appending) files together, Which one gets control?

Very simple, that one whose address is stored in the $02E0 vector.
You could specify an init address somewhere in the middle of the
chained file. Then DOS jumps to this routine. In order to continue
loading you have to exit your init routine with an RTS instruction.

Hope that helps
-Marek

If you have a Percomm or an XF-551, you can easily upgrade both (the
XF551 already uses 360k mechs, but can be upgraded beyond 720k), whereas
the Percomm can run up to 1.44meg 3.5inch drives.. Just install the
mechs inside those cases and off you go!

168. 1050 Problem

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-20 17:24:23 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9301201653.AA02823@smithkline.com>
Source record: 108480

This is for the person who reported a problem with a 1050 that wouldn't stop spinning. Dean Garraghty mentioned he thought it was the FDC chip, & I think he's probably right.

However, there is one thing to try befor you go off buying a new FDC. (The FDC, BTW, is the most expensive chip in the 1050, you'll pay like $12-$15 for it! Ouch!) What I'd suggest is to first check all the socketed chips: remove them from their sockets & plug them back in again. I had a 1050 that went sour on me, & it turned out that the socket in which the FDC was plugged was chock-full of solder resin, it was a wonder any of the pins made metal contactat all. This was obviously a manufacturing defect, it took several years of thermal cycling to show up. It also drove me crazy. Sometimes the motor would start spinning all by itself, other times it wouldn't respond, & then there times when it went on-off-on-off. Crazy thing.

If the 1050 was purchased used, watch out. I've gotten used ones where people had messed up the innards. The wrong ROM for the mech type (Tandons & WS mechs each had their own ROMs), and/or the wrong jumper configuration for the ROM can produce a variety of weird behavior. I once started investigating all the possible combinations of mechs/ROMs/jumpers to record the effects, unfortunately that experiment was one of many that was permanently interrupted when my house caught fire in '91. I was prompted to begin that investigation when I purchased a basket full of broken 1050's at the 1990 WAACE Fest & found many of them behaving in bizarre ways. Of the 15 or so I bought, I eventually repaired all but one (that one was a true basket case, where someone had butchered the board with a soldering iron.) In my experience, I would rank the top three chip failures in the following rank order (#1 is most frequent failure):

1.) The 6532 PIA
2.) The input transistor chip (CA3040?? Near the SIO socket.)
3.) The 2793 FDC.

Hope this helps.

170. M.U.L.E. vs Colony

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-20 21:23:00 UTC
From: ultron@csd4.csd.uwm.edu
Message-ID: <1jkfrkINN94u@uwm.edu>
Source record: 108482
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I just saw a file on the archive site called colony.lzh which is listed as a clone of the game M.U.L.E. I've never played M.U.L.E. but it continually pops up on c.s.a.8 as one of the, if not the, greatest games for the 8bits. Is Colony a good representation of M.U.L.E.? Are there any differences that make one better than the other?

You missed a very important subtlety in this system. First, there is a difference between the RUN address and the INIT address (and I, too, cannot remember which is at $2E0-2E1 vs $2E2-2E3). When DOS loads the INIT address, it does a jsr to that address _immediately_ (without continuing the load). When that code does and rts to DOS, DOS picks up with the load where it left off. This means that you can have multiple INIT addresses strewn through your load file and they are treated like subroutines to the load process (be sure the code they run has already been loaded, though :-). In the case of the RUN address, only the last value stored here matters. This is the one that DOS jsr's to _after_ the load is complete.

Now, can someone with a memory map handy verify which address is which? I'm not sure where my memory map is.

The only reason that I didnt reply to this message in E-Mail is because
I think that everyone should know... Colony Blows!! If you have an
8-Bit play M.U.L.E. If you don't have an 8-Bit, go buy one and play
M.U.L.E... Colony contains NONE of the cool stuff that makes M.U.L.E.
great!! It looks like crap and sounds even worse...

Course this only an opinion of someone who has devoted his life to the
ongoing quest for perfection of the M.U.L.E. scenario.. Ahhhhh.

Computer Software Services repairs most Atari 8-bit related computers
and disk drives. I suggest you call them at (716) 429-5639 to arrange
shipping and all that. Repairs usually cost about $30 on most jobs.

Jeff,

Very interesting story about using your 800XL and Monitor in your car. I talked briefly to Ben Poehland about this car stuff, and he suggested some heavy duty noise and surge filtering on the 12V DC line that is powering any 8 bit equipment one plans to hook into their car. I think all of this would make a great article to read about , I know I'm curious to know more about how you hooked things up to the car. I'm fascinated by your accounts of what the police officers thought of the whole thing!

180. Fractasia v1.58 in the Archive.

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-22 02:55:21 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01GTSNAXO6GY91YCEI@vax.edinboro.edu>
Source record: 108491

Now in the Archive is:

Fractasia v1.58
Shareware from
Analog Concepts in Digital
(c) Jan. 1993

FRAC1.ARC - Main Program (side 1)*
- Example .SET files (side 2)

FRAC2.ARC - Jeff Potter's ColrView program.
- Many pre-generated .R.G.B files.

Fractasia is a fairly elaborate Mandelbrot Set generator that generates
Fractal images in Atari OS modes 3,5,7,8,9,10,11,15 and even supports
ColrView for 160x192x64 resolution. I obtained Jeff Potter's ColrView
and APACview programs a short time ago and, since I was already doing some
fractal programming, I decided to combine the two. (Fractasia only generates
the .R .G .B files and ColrView is required to view them).

Additional features include:
Save/Restore/Resume calculation.
Variable size and proportion ZOOM BOX.
Color Cycling (of OS modes).
DMA on/off.
SpartaDOS X compatibility. (Will not function under SD3.2).
Works GREAT from a hard-drive.

In the Works:
Fractal Landscapes.
APAC support.
A Fractal Animation Package. (Animated Zooms and Pans and such).

The Program was developed under SpartaDOS X and is written in Turbo Basic
(compiled) and will function on any machine that Turbo Basic programs will
run on. (Fractasia has also been tested under AtariDOS and variants).

Fractasia is ShareWare. A completely voluntary $5 donation is suggested
but if nothing else, I would like all users to fill out the registration
form so I can keep you informed about updates.

NOTE: This program has not undergone any 'real-world' testing yet!
I have debugged it the best I could on my own (with the help
a couple Beta-Testers). Bugs are bound to show up and I
encourage you to alert me of any you find. There are many more
freatures that I would like to add, but I want to be certain
that this version works properly.

Peace,
-Adam Conover.

Ok, $02E0 - $02E1 is the run address,
$02E2 - $02E3 is the init address.

I'm have an addition to: There is one problem, that occurs, when you
use any SIO-handler (like P:) in an Init-Part:
All IOCB-Blocks are copied into the zero page, when an operation
is done on any channel.Normally, this doesn't matter, because
on every SIO/CIO call this is done. But when you do it in the init part

of a COM-File and then return to DOS (with RTS) , sometimes
something strange can happen. For instance, I've programmed
one time an Init-Part that sended a text to the printer (p:),
and after the RTS, Dos continued to load, but the floppy didn't
READ from the file, but WROTE to it, because I've opened before
an IOCB to the Printer with open #x,8,0,"P:". The only solution
I saw, was to save the zero page IOCB before outputting to the
printer, and afterwards to restore it.
The same thing can happen, if you use handler-routines in the VBI
(for instance a T:-handler to get the current time from an
real time clock).

To: INET::"comp-sys-atari-8bit@cs.utexeas.edu"
CC: POEHLAND
Subj: FEBRUARY AC: ON THE WAY!!

Well last nite I spent 2 hours on the phone with our publisher, correcting the final proofs of the Feb. AC. It will go the printer probably Monday Jan. 25. Assuming the printer isn't backed up, printing will take a week. Which means the Feb. issue will get mailed out during the first week of February.

Actual delivery to mailboxes will probably commence Feb. 20 & likelt continue in smeared-out fashion thru March 15.

I was about 2 weeks late completing final assembly & editing. I had hoped we'd be mailing it out around Jan. 18, but that was not to be. A series of crises totally derailed me, beginning right around our copy deadline on Dec. 5. Under the circumstances, I did extremely well to only be 2 weeks late.

The highligts of events are as follows. Due to the slow November delivery of the December issue, incoming subscriptions peaked during the first 2 weeks of December. New requests for the Premier Issue also rose steeply. I was unable to deal with all that PLUS commence work on the FEb. issue AND our Softare Disk. I ended up spending all my time processing incoming subscriptions & outgoing requests. I finally ended the logistical nightmare by halting free distribution of the Dec. issue on Dec. 15, although a final batch of freebies was mailed out Dec. 28. During that same period, a personal crisis developed with our Advertising Editor. I devoted enormous resources in an attempt to salvage the situation, but in the end it was for naught. Our Ad Editor resigned just before Christmas. (I've since interviewd 2 people for the job with no luck.) He hung in there long enough to secure some ads for the Feb. issue, but with the position unfilled prospects for ads in future issues are now uncertain. Coordinating the Softare Disk with the Magazine turned out to be extremely tedious (one of those things where you have to do something before you can do it). The disk problem was aggravated by the fact that our Disk Editor was buried under 9 feet of snow, with power outages & the roof of his house buckling under the weight. Despite these difficulties all editing of the disk is complete & the disk is now in duplication. It will probably be mailed out around the same time as the magazine. Since the disk goes First Class it will probably hit mailboxes during the period of Feb. 13-27. (The disk is mailed seaparately.)

I made up the lost time by taking extra vacation days during Christmas-New Year. With the exception of Christmas Day, I spent my entire vacation assembling/editing the Feb. issue. Editing was finished Jan. 11, typesetting completed Jan 18, & proof correction will be finished today (Jan. 22).

There have been many inquiries about subscriptions. We distributed approximately 1700 free copies of the Premier Issue during the period of Oct. 10-Dec. 28. As of this date, paid subscriptions total somewhere around 350-400. Of the original 615 people who returned cards during Jeff McWilliams' 1992 Mail Campaign, fewer than 200 have honored their pledge. I won't comment on that.

However, AC needs 500 subscribers to maintain a full production schedule. There are 3 results of the 8-bit community's faiulure to reach that goal, as follows:
1.) AC won't maintain a full bimonthly schedule in 1993. I'm guessing we'll do 5 issues, with the slowdown coming during the summer months when things are slow anyway.
2.) We won't be able to afford a 2nd Class mailing permit. That means AC will continue to go out 3rd Class Bulk, which is the Slowest of the Slow. Non-North American subscribers who opted for Airmail service will receive their issues before we in the USA/Canada will (!).
3.) We will be stuck at 32 pages. I had hoped to increase page count to 40, but not without the Magic 500. Not even Alchemists can squeeze blood from a stone.

Having delivered all these sobering facts, let me ay there IS a bright side. Those of you in the ranks of the Faithful & Patient will be richly rewarded. If you liked the December issue, the Feb. issue is EVEN BETTER. Despite the 32-page limit, we squeezed in MORE ARTICLES by reducing the font size. Plus, there's the Software Disk, to which Steve Hoffee has added his own brand of sparkle. All meat. No fat.

On Feb. 1, the few remaining copies of the Premier Issue will become Back Issues. Back issues of AC & the disk will be available for $3 each, checks payable directly to Ben Poehland.

Subscriptions may be ordered at any time. $25/year for the magazine, $9/year for the disk (non USA parties, please inquire for overseas rates). Checks payable to: Atari Classics, 179 Sproul Rd./Rt. 352, Frazer PA 19355 USA.

Some Really Neat Stuff can happen when our subscriber list reaches 500.

Well, I finally got the sourcecode to MyDOS 4.5... in Mac65 tonkenized format (for those of you unfamiliar with "tokenized" format, if you know anything about BASIC, and understand the difference between a "SAVE" and a "LIST"... a "SAVE" writes the file in a code... an example (not true, however) would be 1 = PRINT 2 = REM etc.. while a list would actually write out the same data you'd see on the screen when you list the file (the characters "P", "R", "I", "N", "T", would be sent to the file, device, etc.))

Anyways... in the README.DOC file of the MyDOS source, it says that ANALOG #60 had a file that could read Mac65 tokenized source and "list" it for you, but I don't have any ANALOGs, or this file, nor do I know what this file is called (issue #60 was all that was specified)..

so.. if anyone has either.. the MyDOS 4.5 (DUP only, is ok with me!) sourcecode as TEXT that's readable by humans, OR that ANALOG program from issue #60, PLEASE e-mail me!

thanx!!!

Oh come now Adam, you have a DOS manual, don't you? I know that at least DOS 2.5's manual explains it all, and that MyDOS's manual might explain some..

Also, check out the PD program "BINVIEW" which shows you what chunks of a binary file goes where, and explains a bit on how it's done...

including RUN and INIT addresses!

Re: Adam Conover's STEREO demo uploaded to the Archive.

Hmm.. I wonder if it was pre:Gumby, since you (Adam) said that it (the demo) needed two machines...

interesting... do they talk to one another via joystick ports or SIO ports? (can that be done!?), or do you just "press the [SPACE] bar on both computers at the same time"!? :)

I've had thoughts of making a game (or games) (dunno WHAT tho!) (better be something GOOD and INTERESTING, of course!) that would use one computer for the sound, using digitized samples (perhaps as music only, or sound only, or hey, even 3 computers? one for sound FX, one for music, and one for game/graphics/CPU!?!)

Get the picture?

>I< think it's a cool idea! :)

> Bureaucracy (Infocom). [Yes, there was an 8bit version]
>
Are you sure? I used to get the 'New Zork Times' which listed which games
were available for which machines, but I do not remember ever seeing
Bureaucracy for the 8bit. I wanted it, but it wasn't available. I also
wanted the funny one " Burt and Norb ..." (or whatever their names were).
It made me mad that it was available for the C64 but not the Atari 8bit.

An rverter is far better for standard rs232 applications and very cheap
and easy to build.

Hi folks

Sometimes I think there are a lot of people out there using their
ATARIs with a wrong or old DOS.
There is a large number of Disk Operation Systems (or versions of the same)
out there.
It's hard to overview all that even for most of those old 8 bit wizards.
They use a DOS (get used to) and only look out for the newest version of
it.
Most of the DOS users have no idea, which secret abilities some DOSes have.
So, I want to write some kind of article (or series) reviewing all known
DOS versions. I'm sure that I cannot own every DOS ever published.

So I request YOUR help. Here's a list of all DOS versions I own.
If you have other/newer versions of a DOS or different DOSystems,
mail me a few sentences about the major abilities of it (its name of course).
I will keep in touch with you.

BEN POEHLAND/JEFF McWILLIAMS : Are you interested in publish this stuff in
AC ???
If yes, drop me a line...

--==rossi==--
rossi@cs.tu-berlin.de

Oliver Rosenkranz

List of DOS I have :

official ones : DOS 1.0
DOS 2.0
DOS 2.5
DOS 3.0
derivations : DOS 2.6f
DOS 2.9
Funny DOS 3.0
DOS 2.5m
DOS IIs

DOS from others than ATARI :

Happy DOS 1050
K-DOS
(Multi-Boot XL! 4.0)
XL-TOS 1.0
G.O.S. 1.3
MachDOS v2.6XL

Antic! DOS 4.0
Warp-Speed-DOS v2.0
Action!-DOS
GEM-DOS
Turbo-DOS XE V.2.0 HS

DOS II+/D (v4.3 & v6.1)
Bibo DOS (v5.4 RN/RF/RNXF & v5.5 RF)
Smart-DOS / RANA DOS (6.1D & 8.2D)
DOS XL (v2.30)
TOP DOS (.2 & 1.5a)
SpartaDOS (1.1 & 3.2c)
OS/A+ V.2.00/4 DOS
MyDOS (3.013 & 4.50d)

That's all for today...
And I promise you (SpartaDOS isn't the best for *me*). There are some
real good Disk OS out there.

Try reading "Mapping the Atari". It is the best book I have ever seen
for the 8 bit and it is a shame there was none done for the "ST" series.

Now you have dos beaten try a boot disk, the first 6 bytes tell you all
you want to know about the disk.

Happy days

Yes, an article(s) on Atari 8-bit OS's would be interesting, but you
may have trouble pulling all the nasty threads apart: my understanfding
is that there were many DOSs running around, that were a legitamite
DOS, with someone else's name slapped on the front, like the famous
"<first name deleted> <lastname deleted too> Pirate DOS", where the
COPY DISK function was replaced with the label PIRATE DISK, and a
message was put on the screen, saying that this option would
"copy ANY disk". (Of course it didn't). By the way, I didn't see
MyDISxxxx MyDOS on your list....

Ok, so Berkeley went out on vacation with their mail-to-news-reroute-whatever-
-thingy, and some texasy place opened a new route to c.s.a.8!
So.. Back to business.
I have the full solution to Infocom's Hitchhiker's Guide to the Galaxy on me.

Hmmm..... Infocom never did advertise a sequel to come, did they?
Well, they sure do in the end of the game, to which I got.
I guess there'd be no harm in posting it and "ruining" people's games, since
most owners of the game gave up on it years back...
I just recommend that, while reading it, you read up to where you got stuck,
then STOP!!!!! Try to continue the game from that point on.
DO NOT READ ALL OF THIS MESSAGE, that WILL destroy your fun.
Enjoy! (btw, I dunno where I have this from, some douglas-adams-fan group)

GameSig Archives Page GSA-1752

The Hitchhiker's Guide to The Galaxy

Ok everyone, hang on to your seats (and your towels!); this is probably going
to be the wildest adventure game you'll ever play...unless Infocom comes out
with a sequel, which they just might do!
Before we get started, a few words of advice. This is not the only way of
getting through the game. Many of the problems and situations (such as the
whale's belly) have more than one solution. So, you might want to save the
game from time to time, and experiment a little, to see if you can find other
ways of doing things (actually, it's wise to save the game anyway, in case you
make a mistake).
Also, consult the Guide frequently during play; you will gain some useful
insights to some of the objects you come across, and even some helpful
information (sometimes). And remember, no matter how bad things may look:
DON'T PANIC!
Here you are, mild-mannered Arthur Dent, about to start the worst day of your
life, although you don't know that...yet! Actually, the day is already getting
off to a bad start, since you've just woken up in the dark, with a really bad
headache (and it's all downhill from here).
The first thing you need to do is stand up and turn on the light. That's a
little better, anyway! Or maybe not, since you're having a hard time getting
coordinated. Grab the dressing gown and put it on, then look in the pocket.
Ah, an analgesic! Take that, then get the screwdriver and the toothbrush, and
head South to the porch (did you hear a tree fall? Rather omnious, isn't it?).
Here you find something no modern home should be without: junk mail. Take
the mail, and go on outside. Uh-oh! There's a very big bulldozer on its way to
level your home, and there's Prosser standing by, watching it all. Are you
going to take this lying down?
You bet you are! That's the only way to stop it: lie down in front of the

bulldozer. No matter how close the thing gets, don't panic; it won't run you over (of course, in a short time, it really won't matter what happens to the house, but you don't know that yet). Just wait awhile until Ford Prefect shows up (read the junk mail while you wait).
Ford seems a trifle preoccupied with the sky, but he is aware enough of you to try and give you back your towel. Don't take it, or he'll leave and you will be a lot worse off than you ever imagined (can things be worse than this? They sure can!).
Instead of taking the towel, ask Ford about your home. He will eventually come to his senses, and realize what is going on. When that happens, he will be able to persuade Prosser to take your place in front of the bulldozer while the two of you head off to the pub to hoist a few.
As soon as Prosser takes your place, go South and West to the pub. Buy a cheese (?) sandwich while you wait for him to arrive (when you read the description, you'll understand about the "?"). When Ford gets there, he'll buy you a few beers. Drink only three of them.
Around about the time you've finished the third one, there will be a loud crash. In fact, it's the sound of your home being demolished by the bulldozer (that will teach you to trust anyone who wears a digital watch!). Don't take that sitting down, leave the pub and return to where your house used to be. Along the way, you'll see a starving dog.
While you may wonder if anything could eat that sandwich and survive, give it to the dog, who will (amazingly!) enjoy it immensely, ignoring a microscopic space fleet that whizzes past (remember that fleet). Then continue on to the ruins of your home (Ford will be right behind you).
And just about now, to put a perfect ending to a perfect day (which has just barely begun), the Vogon construction ships appear, to demolish the Earth to make way for a new Hyper-space Bypass (hmmm, maybe Ford wasn't kidding when he said he was from another planet, or that Earth would be destroyed in a short time).
Still, don't panic...wait until Ford drops the Sub-etha signalling device. There won't be much time after that, so pick up the device, push the green button (if you dropped the Aunt's thing, have no fear: it will turn up again later), and you will be in....the dark.
Get used to that, you'll be spending a lot of time there before this adventure is over. Notice that, at first, you can't do much. All your five senses seem to be out of order. However, if you wait, and read the descriptions very carefully, you will see that eventually, it mentions only 4 of your senses. The one that's missing is the one you can use. Keep this in mind, it will come in handy later.
Right now, your nose seems to be working again, so smell. Sniff, sniff. Ugh! Whatever it is, it sure is strong! You are also now dimly aware of a shadow, so look at it. Well, well, it turns out to be Ford Prefect! And, looking around, you find yourself in the hold of a Vogon ship. Certainly better than being on Earth (or where Earth used to be).
There's a glass case with an Atomic Vector Plotter inside, but don't bother with it yet. You have something else to do first, namely, obtain a Babel Fish. That shouldn't be hard, right? All you need to do is push the button on the dispensing machine, and you'll have one, right? Hehehehehehe!
Those Babel Fish are pretty slippery characters (but, you may have found that

out already for yourself!). And the cleaning robots are certainly no help; they seem to have only one mission in life: grabbing your Fish away from you. Well, we really can't let that happen!
So, first thing to do is remove your gown and hang it on the hook. Now, wait for Ford to curl up, then get the towel and the satchel. Put the towel over the drain, and the satchel in front of the robot panel. Now comes the part that drives most people crazy: they don't know how to stop the upper-half-of-the-room cleaning robot. But, it's so simple: just put the junk mail on top of the satchel.
Now you can push the button! Then step back and watch the Rube Goldberg shenanigans, which end with the Babel Fish stuck solidly in your ear (squish!). Bet you never thought outer space would be like this! However, now that you have the Fish, you'll be able to understand anyone who talks to you. By the way, somewhere along the line, you will get a message that one of the phrases you've used was instrumental in starting a war that wiped out most of a small galaxy. There is nothing you can do about this; no matter how you try, it will come to pass. Rather unfortunate, isn't it? Even more unfortunate, sooner or later, the survivors will figure out how that happened, and they will be looking for revenge....but more about that charming prospect later.
Right now, press the switch on the case. This will tell you what the code word is that will open the case so you can snatch the plotter. Make careful note of what word is required; it is chosen randomly each time. Too bad you have to listen to some pretty rotten poetry to get the word.
Speaking of poetry, in a short while, you and Ford will be hustled into the Captain's quarters, and strapped into Poetry Appreciation Chairs (worser things could happen, but right now, you probably can't think of any). After the Vogon Captain has tortured you with the first verse, grit your teeth and enjoy the poetry. He will then, to your dismay, read you the next verse. While you could easily live without hearing it, in this case, you do need to listen so you know the word to type in. Fortunately, after the second verse, you don't have to enjoy the poetry. Unfortunately, since you survived both verses, the Captain is going to have you and Ford shoved out the airlock (you have now found something worse than appreciating Vogon poetry).
While Ford tries to talk the guard out of spacing the two of you, type in the word from the poem. You must put quotes around the word, or it won't go through. Then get the plotter when the case opens. Now just wait awhile, and you and Ford will soon be in the airlock, with very little time left.
In fact, time has just run out, and there you are in the depths of space. Lucky for you, the Guide explained how to survive all of 30 seconds out there! Well, perhaps not so lucky, since, considering the vastness of space, it's quite improbable that another ship will come by to pick you up before the 30 seconds run out. So naturally, 29 seconds later, the Heart of Gold (the HOG) comes past and picks you up.
There you are in the dark again. Wait and watch the display, until it no longer says you can't hear. Then listen, and you will hear the sound of the star drive. Now it gets cute: the program will lie to you, and say there is an exit to port. Don't you believe it! Go Aft instead, and you will be in Entry Bay 2. You can ignore the brochure, if you like.
Go Aft again, and you're in the Fore End of the corridor. Here, Ford will find you you, and take you up to the bridge, where you meet Zaphod and

Trillian. Actually, you've seen them both before, at a party you attended a short time ago. While you listen to the chatter between Zaphod and Ford, you can begin to drop some items here.
You can drop the plotter, screwdriver, gown, and signalling device. By this time, everyone else has gone to the sauna, leaving you alone on the Bridge with Eddie, the shipboard computer. Don't mind Eddie, he's a little over-protective, but he's a good sort at heart. In fact, you can pretty much ignore him, as well as Marvin the Paranoid Robot, although Marvin will be important much later on (depressing as that may sound).
Ok, time to prepare for some pretty weird happenings! First you'll need the spare improbability drive. So, go down, then Aft. Keep going Aft. The program will tell you that the Engine Room is dangerous. It LIES! Don't listen to it, just keep going Aft. Eventually, you'll get there.
Of course, as soon as you're there, you'll want to look around. The program will tell you there is nothing to see. That, too, is a lie! Keep looking, and you'll find that there are some things to see here, especially the spare drive. Don't worry about the tools for now; you can leave them where they are. Once you have the drive, go back to the Fore End corridor, then head Port where you'll find the Nutrimat (try consulting the Guide about the Nutrimat). Touch the pad, and you will be provided with a delicious (?) cup of advanced tea substitute. Fortunately, you don't have to drink it. Take the cup (ignore the carton, it's useless) and return to the bridge.
Drop the cup and the drive. Now, plug the small plug in to the small receptacle, and put the plotter's dangly bit into the tea substitute. Ok, you are about to have some pretty strange experiences, but before you throw the switch, some words of advice and caution.
There are five scenarios (all rather short, but all of them important), that have to be completed. They come up in random order, so each one has its own little section of the walkthru. The lead-in to each of them is that familiar dark area, where you have to wait until one of your senses is working again. You will be in the dark area again when the scenario ends (and you will have to listen for the drive sound), which will then bring you back to the HOG. Also, be aware there are times that you may briefly go back to one of the scenarios you have already completed. You just sort of bounce in and out of those, but you do have to spend time waiting in the dark. I couldn't find a way around this, so you'll just have to live with it. Finally, it's a good idea to save the game after you complete each scenario, just in case. With that said, it's time, so push the switch!
The Bugblatter Beast When you come out of the dark, you find yourself in the Lair of the dreaded Bugblatter Beast. There are, perhaps, better places you could wish yourself to be in, considering that, among its many charms, the Bugblatter has those tungsten-carbide vast-pain claws (perhaps he was a dentist in a previous life).

However, you are here for a purpose, so you'll just have to do something about the Beast. Consulting the Guide tells you that Bugblatters are incredibly stupid, which is certainly the case. In the meantime, the Beast is bearing down on you, demanding your name. Don't be shy, introduce yourself, then run like heck East out of the Lair.

Pick up one of the sharp stones, and then cover your head with the towel. Old Buggy is so dumb, he thinks that, since you can't see him, he can't see you. But, this won't last for very long, so you have to fool him, and quickly. Lucky for you, this isn't hard.

Carve your name on the Bugblatter's memorial. When he sees the name there, he will think he's already eaten you, which is why he can't see you (dumb may be an understatement here). The Beast will then curl up for a nap, leaving you free (after removing the towel!) to re-enter the Lair and then go SouthWest.

Here you will find the skeleton of some poor soul clutching a Nutrimat Computer Interface Card. Take the card, and just wait around for awhile. You will be mistakenly captured as a Bugblatter Beast (talk about insults!), but you will eventually be freed, and have some other adventures along the way, before you find yourself back in the dark again.
When you get back to the HOG, you can drop the asteroid paint chipper and the interface card in the Fore End before going up to the Bridge (you'll need the interface later, but there's no need to drag it around with you now). Once on the Bridge, push the switch again, and you'll be back in the dark.
Trillian The dark ends with something liquidy to the touch. In fact, you find your fingers bathing in a glass of wine. Coming to your senses, you realize that you are now Trillian, and you are at the party where you (she?) met both Arthur and a mysterious man named Phil.

Take a good look at Arthur, and you will see he has a huge ball of fluff on his jacket. Just what you want, but your hands are full. Drop the plate you're holding, and get the fluff. Open your handbag and put the fluff in it, then get the plate again (otherwise, the pushy hostess won't leave you alone).
Now, all you need to do is wait, trying not to be bored to tears by Arthur's feeble attempts at conversation. Give Phil a look, and shortly he will come over, and take you out to his scooter. As you blast off, everything once again becomes.....dark.
Ford Now you find yourself standing in a country lane, holding a satchel. The place looks familiar. In fact, it's the lane outside Arthur's home, and this time you seem to be Ford Prefect.
Those Vogons will be arriving soon, so there's not much time. Open the satchel, and take the satchel fluff, the towel, and the sub-etha signalling device. Go North, and there you will see Arthur lying in front of the bulldozer.
With a certain feeling of deja vu, you offer him the towel. However, instead of taking it, he asks you about his home. You suddenly realize what is going on (not that it really matters, considering what will shortly happen!). In a moment of magnanimity (or possibly madness), you decide to take Arthur hitchhiking with you.
But first, you have to deal with Prosser. Go over to him, and ask him to lie down in front of the bulldozer. He'll make a little fuss, but you'll manage to persuade him. Now, you and Arthur can hurry over to the pub, and drink some beer (remember to buy peanuts).
Sit there, drinking your beer (no more than three!), meditating on why Arthur is taking the imminent demise of the world so calmly, until the house falls and Arthur goes tearing out.
Follow him to the ruins of his home. Drop the satchel, and put the satchel

fluff on top of it. Now wait. The Vogon ships will appear, the winds will pick up, and you'll start fumbling with the device.
Oops! You just dropped it! Fortunately, it rolls over by Arthur, who picks it up and looks at it. Also fortunately, Arthur manages to push the right button, and everything becomes....dark.
Zaphod You come out of the dark to find that you're now Zaphod Beeblebrox, the Presi dent of the Universe. In fact, you're on your way to steal the Heart of Gold (with a little help from Trillian).
As your speedboat zooms towards its destination, search the seat carefully and you will find seat fluff and a key. The key opens the toolbox, but you don't need to do that now. Just make sure you take the box; you might be needing it later.
Now, if you continue on your present course, you'll never make it between the cliffs and the spire (or maybe you know that already). The trick is to make the auto-pilot do the hard work, so steer the boat towards the rocky spire. The spire gets closer...closer....closer....and then, at last! the auotpilot wakes up, just in time, and steers you to safety! Whew, that was a close one.
Ok, now you can stand up and go North to the Dais, where the dedication ceremonies will be held.
Wait around, enjoying the cheers of the crowd (read the banner if you like), until Trillian appears. She will jump out of the crowd, and hold a gun to one of your heads. The guards are a little hesitant about what to do, so now's your chance: tell them not to shoot.
After a few moments, they will drop their rifles into a pile..just what you've been waiting for. Tell Trillian to shoot the rifles. As the weapons disappear, you and Trillian make a break for the HOG! You made it!!
But...everything seems to be getting....dark.
The War Room Ah ha, fooled ya! I bet when you heard the sound of the star drive, you thought you were back on the HOG. But, surprise! you're in the War Room of a mighty war fleet approaching Earth (at least you're yourself this time!).
Hmmmm, looking around, you see an ultra-plasmic awl. Pick that up, since it might come in handy later. Now, take a good look at the aliens. They are Vl'hurg and G'guvunt. Sound familiar? Ring any bells? Remember that small galaxy you pretty much wiped out with your careless words?
Well, they finally figured out what happened, and now they are on their way to Earth to take revenge! (Uh oh) You can't really stop them, so just wait around and hope for the best.
The fleet gets closer and closer, and then arrives. Amazingly, the first thing they see is....a huge dog happily munching a cheese (?) sandwich! The sight of this giant monster, contentedly eating, softens the hearts of the Vl'hurgs and G'guvunts.
With a new mission in life, they turn around and go home. Along the way, they transport you back to the HOG. Unfortunately, since the aliens are microscopic, so are you.....and you end up materializing inside your own head!
But wait....maybe there is a madness in this method, after all (or is that the other way around?). Move along the mazy of synapses (any direction will do, they're all alike), until you come to the particle.
Look at the particle, and you will see it's your common sense. If there's one thing you surely don't need in THIS adventure, it's common sense, so take the

particle. Whoops! Everythig just went.....dark. Ok, now you should have collected the four fluffs, the ultra-plasmic awl, the paint chipper, the nutrimat computer interface, and the tool box. After you have done the last scenario (whichever one that is), don't go back to the Bridge. Pick up the interface, and go to the Nutrimat. It's tea time!

Open the panel on the Nutrimat, remove the circuit board, and replace it with the interface. Now, touch the pad. With a clearer idea of just what it is you want, the Nutrimat begins to have some problems. Its own limited circuitry can't handle it (well, it's just a dumb machine, after all), so it ties into the main shipboard computer.

Don't spend time here watching the Nutrimat go through its gyrations. Head for the bridge, and plug the large plug into the large receptacle. The moment is almost here: the HOG has arrived at the legendary lost planet of Magrathea, and the natives aren't friendly.

In fact, they are sending up a bunch of missiles to vaporize the HOG (hmmm, they really AREN'T friendly!). Now, push the switch on the spare drive. Wow! Talk about improbabilities! The missiles have turned into a giant sperm whale! After accepting the congratulations of Ford, Zaphod, and Trillian (who conveniently disappear into the sauna again), return to the Nutrimat, where you will find, at last, a cup of REAL tea. Get the cup (you will drop the No Tea), but don't drink it!! Bring it to the Bridge.

Drop the real tea (you will automatically pick up the No Tea). Remove the dangly bit from the tea substitute, and put it in the real tea. You have one more little trip to make. First, however, drop everything you are carrying except the Babel Fish and the Aunt's Thing (yes, you have it again, you just can't get rid of it).

Push the switch on the Drive. After a short stay in the dark, you will find yourself in the whale's tummy (it may, however, take more than try to get here, but you will make it eventually). There's a flowerpot here! Get the pot, and put it in the Aunt's Thing. Now, wait around (you really don't have a choice), and soon you will be in the dark again.

Ah, back on the HOG at last. If you take inventory, you'll notice you don't have the Aunt's Thing. Don't panic! It will, as always, turn up. In the meantime, go around picking up the various fluffs. The Zaphod fluff, along with the tool box, will be by the hatch. Trillian's, of course, is in her handbag, and Ford's is on the satchel, and the last one is in the pocket of your gown (unless you took it out earlier and dropped it somewhere).

The Aunt's Thing has reappeared by now, so go up to the Bridge. Take the flowerpot, plant all four fluffs, drop the pot, and wait awhile. When you see a tiny sprout has formed, take the pot into the sauna. When you emerge, a changed man, you will also have a changed plant.

However, there is another problem! The HOG has landed on Magrathea, but Eddie, overprotective as usual, has jammed the hatch shut. And, he's not going to open it, no matter how long it takes him to check for dangers on the planet (which will be quite a few years). You are almost ready! First, eat the fruit from the plant (mmm, tasty!). You have a vision, and pay close attention to it: the vision shows you what tool Marvin will need to open the hatch. This varies from game to game, and there is no way to know which one it is until you eat the fruit. That is also why you have to collect all those tools. Get the tool that you saw in the vision. If it happens to be one you haven't seen

yet, then you'll find it in Marvin's pantry.
The trick now is to find Marvin, and he's in his pantry, behind the screening door. First, get the real tea. You automatically drop the No Tea. But, you don't have your common sense anymore, so....pick up the No Tea! Now, you have both Tea and No Tea at the same time!!
Go to the Screening Door. Open it. The Door, impressed by your being able to have both Tea and No Tea will let you through! However, WAIT!!! Don't go through the door yet! If you set foot in the pantry, you will be overwhelmed by depression! So, that magic moment has arrived, the moment you've been waiting for ever since you left Earth: drink the real tea!! (Ahhhhhh, good to the last drop!)
All right! Now you can go into the Pantry (yay)! Marvin will be there, sulking as usual. Tell him to fix the hatch. Marvin will grumble, but he will agree to it, and tell you to meet him at the Hatch Access Space, with the proper tool, in twelve moves.
As you already have the tool (thanks to the fruit), you can go directly to the Access space (drop everything but the tool and the Fish), and wait for Marvin. When he arrives and asks for the tool, give it to him. Marvin will fiddle briefly, and the hatch will slide open.
Go out to the Hatch, and then down the Hatch. Wow! You have now set foot on the legendary lost planet of Magrathea, and.....
And what comes next, will have to wait for the sequel (and let's hope it isn't too long a wait!!!)! 2.3

200. Happy Cursor

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-25 00:14:15 UTC
From: yabi@ellis.uchicago.edu
Message-ID: <yabi.21.727920854@ellis.uchicago.edu>

Body handling: Inline uuencoded payload not displayed: happycur.obj

I was going through some of my old atari 8-bit disks with my ibm compatible (using the ATARTIO program), and I found this nifty little program/demo that I wrote years ago.
The program utilizes VBIs, DLIs, and PM graphics to change the cursor into a multi-colored happy face. I got the idea from an old Analog article by Tom Hudson, "An Alternative Cursor." (although his cursor was just an underline).
Problem is, I'm not sure if this file will work. I don't have my 8-bit with me, and I can't test it. So....I'm posting the object file here, uuencoded. I'd appreciate if someone could test it, see if it works. If it's okay (respond to me through email), I'll upload the program (along with the Mac/65 source) to the 8-bit archive.If I remember correctly, the program initially loads about 250 bytes starting at $6000. After it runs, it leaves the $6000 area free, but then uses page four and page six (for the player/missile address base, VBI and DLI routines), I think. So if you're running any programs that use those areas, "bad" things might happen (i.e., lockup!).

thanks,
scott

Yes, the 810 also has the same problem regarding not stopping spinning. In
fact, I repared an 810 with this problem and it was the FDC

Dean Garraghty.

My God good man! I have you (somebody's?) HappyCursor program! The screen goes black with white or grey text, and the cursor becomes a blinking, multicolored happy face. I love that! It was one of the couple of files I was testing out MyNI_DOSes batch jobbing with! Turn on the computer, boot up MyDOS, have MyNI_DOS load up, and bam, up comes HappyCur!

Coolness! I'm sure it works!!

:)

Good job. (but yes, there are meanies that mess it up.. but I think even TurboBASIC XL works with it... don't remember)

205. C vs Action!

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-25 23:41:47 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <cciyXB9w165w@cyberden.sf.ca.us>
Source record: 108269

God, Action! is such a cool language! :) I've been comparing C (which I'll soon be independantly studying on IBMs at school) with it, and it's such a nicer, cleaner, easier to read language.

Well, at least the way I program. I've seen some Action! programs that waste a lot of space with indents and the such, but compared to C, it's far easier reading. (In C, for example, you'd say "If(h<1)h=1;" and in Action!, you'd say "If H<1 Then H=1 Fi", or (if you redefined "Fi" to something even more readable), it would look like this: "If H<1 Then H=1 EndIf"... Also, with C, if you have a "long If", that is, one that does more than one command, you need those damned braces... sort of like this:

```
If(H<1)
{
H=1
O=O+1
}
```

and..

I dunno.. just call me a BASIC lover, but I just happen to think Action! is a far easier language.

Not that C is impossible. (Now comes my point!).. I've translated a program that my friend made in C into Action! (took less than an hour!) which is sort of a screen saver (it was where he got the idea). What it does is bounce lines around the screen.. See the next two posts for the file examples.

Have fun! Oh yeah, I'm also working on changing a little game I wrote in Action! (a very weak shoot-'em up) into C... hahahaa!

Maybe I'll start out ALL my C projects as Action!

hehe

oh, and no, I don't have (use, that is) a C compiler on the Atari.. tho I'm thinking of getting CC65 from the archives. (I have CC8 and have >No< idea on how to use it... but that's just because I don't know C.. yet)

:)

In a previous article, aa700@cleveland.Freenet.Edu (Michael Current) says:

>
>
>Did B&C ComputerVisions run out of them? Their Winter 1992 catalog lists
>Turbofile/80 and Turboword/80 for $44.95 each.
>
>--
Michael,

Yes, I went hunting for Joe back in November for this program and B&C said they just sold out. They said they didn't sell very many though, maybe one a month if they were lucky. There are still some parties out there that I know of who would like to see the rights to turbofile purchased or gotten somehow. It's the best database program I know, especially when it comes to giving your drive a workout. (grin!).

And yes, in case you're wondering, I'm now having to use the Freenet news reader, after two weeks of our local systems saying (no new news) I've had it. These "improvements" the sysadmins keep making on campus are driving me up the wall.

Jeff McWilliams

209. Digi-Studio gets reviewed!

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-26 13:28:19 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Jan26.132819.14450@aber.ac.uk>
Source record: 108271

Digi-Studio has just been reviewed in Page 6 (New Atari User) over here in the UK. They seem to like it, pointing out only a few minor problems, mostly with the manual. So, now you have somebody else's word about Digi-Studio, not just mine. Buy a copy today! If you need the product info and US address to send money to, then please email me.

Dean Garraghty.

Source record: 108272

In article <cciyXB9w165w@cyberden.sf.ca.us> phbill@cyberden.sf.ca.us writes:
>God, Action! is such a cool language! :) I've been comparing C (which
>I'll soon be independantly studying on IBMs at school) with it, and it's
>such a nicer, cleaner, easier to read language.
>
>Well, at least the way I program. I've seen some Action! programs that
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
>waste a lot of space with indents and the such, but compared to C, it's
>far easier reading. (In C, for example, you'd say "If(h<1)h=1;" and in
>Action!, you'd say "If H<1 Then H=1 Fi", or (if you redefined "Fi" to
>something even more readable), it would look like this: "If H<1 Then H=1
>EndIf"... Also, with C, if you have a "long If", that is, one that does
>more than one command, you need those damned braces... sort of like
>this:
>
>If(H<1)
>{
> H=1
> O=O+1
>}
>
>and..

Feh. The underlined phrase may say it all. For my part, I've no patience
with people who say, "I don't like C because it MAKES you do such & such."
Baloney. Try:

```
#define then {
#define endif }

main () {
.
.
.
if (h < 1) then h = 1
endif
.
.
.
}
```

For your second gripe, try:

```
if (h < 1) h = 1, o = o + 1;
```

Granted, that won't work for all complex if's, but it works for small
stuff like the above example.

>I dunno.. just call me a BASIC lover, but I just happen to think
>Action! is a far easier language.

That's okay... like you say below, it's "because I don't know C yet".
I believe C is a very elegant language. Sure, an idiot can still write
crap code in it; but that's a reflection on the programmer, not on the
language.

>>No< idea on how to use it... but that's just because I don't know C..
>yet)
>
>:)

:^) Don't take this as a flame; take it as a learning experience! :^)

Oops. Left off a semi at the end of the if line. Alternatively, you
could:

#define endif ;}

so you could write your code as I originally posted it. Which just goes
to prove that C is more flexible than "you have to do it this way and
this one way only!"

--------------------------------------------------------------------------------
But statistics isn't all....

Here are the features the DOS variants are standing for...

DOS 1.0 -devine device -full of bugs

DOS 2.0 -standard -not very user-friendly

DOS 2.5 -better than DOS 2.0 but not really user-friendly

DOS 3.0 -uses system files -not kompatible to DOS 2.5
-convert DOS 2 -Files -online help
-create your own commands

DOS 2.5m -like DOS 2.5 but without the need to press RETURN
after the command letter
```

DOS II+/D 4.3M -clear disk (delete files & new dir)
-diskname
-mini ml monitor (mem-dump,mem-change,show registers)
-12KB RANdisk (build-in,M: $5000 - $7F00)

DOS II+/D 6.1 -like version 4.3M
-other features ???

Happy DOS 1050 -1011 free sectors (1010 are normal)
-revive file -no RETURN after command

FunnyDOS 3.0 -931 free sectors -drive speed test
-radix convert (hex,dec)-check sectors
-copy sectors
(DOS 2.9 is like this one but with a black background)

DOS 2.6f -like Funny DOS 3.0 but only 707 free sectors
(for ATARI 810 users)

K-DOS -uses system files -revive file
-ml monitor (procede,examine,alter register)
-boots system if RESET is pressed
-kill -UDC

DOS XL 2.20 -uses system files
-other features ???

DOS XL 2.30 -uses system files
-other features ???

Top-DOS .2 -undelete -create your own commands
-ml monitor (read,edit) -bypass-cartridge (choosable)
-set left margin -Auto-RS232 (choosable)
-system drive# -number of buffers

Top-DOS 1.5a -like version .2
-choosable RAMdisk#
-set time-out -error list
-online help -number conversion

SpartaDOS 1.1 -diskname -uses system files
-sub-directories -not compatible with DOS 2.5
-different dir (name,bytes,date,time)
-undelete -system clock

SpartaDOS 3.2c -like version 1.1 -extra date/time line
-easy multifile copy -various disk init formats
-speed check -sector copy

MultiBoot XL! 4.0 -not really a DOS but a disk/cassette-copy/load utility
-not compatible with DOS 2.5
-it options : write MB4.0, load boot prg cass/disk,
write boot prg cass/disk, copy file
rename file,sector copy,format disk
delete file

SmartDOS 6.1D -copy sectors -test sectors
(RANA-DOS) -speed check -easy to use

SmartDOS 8.2D -like version 6.1D
-less memory needed -other features ???

OS/A+ V.2.00/4 DOS -uses system files
-other features ???

MyDOS 3.013 -drive configuration -choose system drive#
-directory name

XL-TOS 1.0 -uses windows,icons,pull-down-menues
-no wrtieTOS,save file,copy file/disk, go address
feature

G.O.S. 1.3 -uses window/icons/pull-down-menues
-sub-directories -change colors
-directory name -disk name/drive name
-print file -edit file

MachDOS v2.6XL -choose system drive# -convert files

BiboDOS 5.4 RN -good RAMdisk support -easy to use
-configuration (#of buffers, RAMdisk resident?,
RAMdisk?,keyboard buffer?)
-startup edit -1011 free sectors
-undelete -dir when number-key is pressed
-supports XF551

BiboDOS 5.4 RF -like version 5.4RN -supports several disk speeders

BiboDOS 5.4 RN/XF -like version 5.4RN -especially written for XF551
users

BiboDOS 5.5 RF -like version 5.4RF -BASIC on/off
-clear disk -show file
-special configuration (repeat frequence,wait time)

ANTIC! DOS 4.0 ???

1050 Warp Speed DOS 2.0 -like DOS 2.0 -supports warp speed

Action! DOS -like OS/A+ DOS -dir shows a line '# of files'

GEM-DOS -uses windows,icons,pull-down-menues,icons for files
-full of bugs

DOS IIs -like DOS 2.0 -special copy routine

Turbo-DOS XE V2.0 HS -short info about all commands (without disk access)
-uses system files -show/edit system variables
-radix convert(hex,dez,ATASCII)
-hexdump/edit -BASIC on/off
-recognizes automatically the density of the disk
-look at load/start addresses/areas of files

-get file checksum -show files
-clear dir -give command chain to cartridge
-write fileloaderDOS to disk (GAMEDOS)
-batch files -disk copy with density-mix
-supports disk speeder -complex but easy to use options for most commands
-online help -support for XF551

---------- without any guarantees ----------

This list is incomplete. To make it more complete and help all users to
choose between DOS variants, please check out this list for failures or/and
lecks of information. If you find some facts I didn't pay attention for,
drop me a line via email (rossi@cs.tu-berlin.de) and I will update this list
and put your name to it, if the hint is new to me/the list.
Even if you have a new DOS or another DOS version you don't find on this list
gimme a description of it with all the facts you know about it which are impor-
tant for the list...

Thank you in advance

In a previous article, cd827@cleveland.Freenet.Edu (Jeffrey J. McWilliams) says:

>Yes, I went hunting for Joe back in November for this program and B&C
>said they just sold out. They said they didn't sell very many
>though, maybe one a month if they were lucky. There are still some parties
>out there that I know of who would like to see the rights to turbofile
>purchased or gotten somehow. It's the best database program I know,
>especially when it comes to giving your drive a workout. (grin!).

That's too bad they've pulled such an attitude, it seems to me they used to be famous for their support. I remember when I bought and registered for Turboword, they replied with a nice, personalized letter responding to most of the complaints I had with the program. Later, they sent the Turboword+ update disk free of charge.

Then again, I really disliked the editor itself, and I never went back to it once I bought AtariWriter 80.

Are you talking about Turbofile being such a great database, or Turbobase? I thought Turbobase was their original, high powered product, and Turbofile was the stripped down version meant to work with the new Turboword product.

I have an 130XE & double density 1050 with minimal software,
DOS 2.5 & Atariwriter +. I'd like to start downloading more
programs, but I don't have a program that can download.

I tried using the util.exe to format atari drives on an IBM PC, but
it formats them in double density. Also it gives me an error:
"Error formatting track 0." Can I get DOS 2.5 to recognize a
double density disk? Is there a way to un-diskcomm the DOSes that
are on the atari.archive so I could boot from one of these PC created
double density disks?

-Rich

Well done Oliver, that file has just been a great help!

(I just bought an 800XL a couple of days ago, with the *original*
or Sparta-DOS, and Smart-DOS. And of course Atari-DOS (2.5).

Looks like Smart-DOS is the best out of the 3.

Date: 1993-01-27 20:04:47 UTC
From: Steve Swanson <SMSwanson@ehssun.lbl.gov>
Message-ID: <28671@dog.ee.lbl.gov>
Source record: 108281

Does anyone have experience transfering files between an Atari 8-bit and
a Macintosh? I connect my Atari to a RS-232 modem through an 850
interface, and also use a RS-232 interface on my Mac. I thought it
would be as simple as a RS-232 to RS-232 null-modem, but someone told me
null-modems have to be individually configured for the computers involved.
Anyone have experience in this area?

>double density disks?

Hmm... let me canvass my memory for this...
Atari DOS 2.0 (and maybe even 1.0) has almost all the abilities to read standard double density disks. Atari had this in mind, as they did create an 815 (?) double density drive in the late 70s/early 80s (never released, though).
Now, in the IO control areas for DOS, there's an address that contains the density byte (0 or 1). It's quite simple. From BASIC, just do a POKE xxxx,1 and _voila_, the DOS will now be able to read/write double density disks for the particular drive numer (the information for all the drives is stored at an address, say $700. The information for drive 1 (actually drive 0) would be at $700. The next drive's information would be at $700+some offset. Next drive info would start at $700+ 2x some offset, and so on).
I've done this before, and it does work.
So, what is this address? I don't know (sorry. POKE 1801,1 or POKE 1802,1 seems to stick in my mind, but I can't be even 5% sure of that).
If someone has a copy of Mapping the Atari, or even better would be Inside Atari DOS, you could easily find out.

220. WANTED: Cartridge Serial Numbers

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-28 01:52:35 UTC
From: chase@electron.rutgers.edu
Message-ID: <Jan.27.20.52.33.1993.22744@electron.rutgers.edu>
Source record: 108280

Hello Fellow Atari 8-bitters,

Back in July I coordinated an effort on this group to create a list of all cartridges produced for the Atari line of computers. Before very long we had compiled a list of over 300 cartridges from a variety of publishers. I have reposted the list on a few occasions since then and have received only a few more additions and corrections. I'd like to consider the project finished but the list has various short comings which should be addressed. I hope that perhaps I can catch the attention of some people who may have missed the original postings, and with their help produce a more accurate list of all Atari cartidges.

To save bandwidth, and because the list is essentially unchanged from its last posting I am not reposting it now. If you want or need a copy of it just drop me a note and I'll email you a copy. Instead I am to post a description of the information missing in the hope that someone out their can fill some of it in for me. Thanks for listening.

The following cartridges I need the serial numbers for.
Atari Atarilab carts, Deflector.
Activision Keystone Kapers, Zenji, Beamrider, Decathlon, Pastfinder, The Designer's Pencil, The Dreadnought Factor
CBS Software Most of them
ParkerBros All except Frogger and Death Star Battle
Sega Tac-Scan, Spy Hunter, Tapper, Up N Down, Frogger II, Sup Zaxxon
Spinnaker All except Delta Drawing
ThornEMI Hockey, Orc Attack, Darts, Tank Commander

The following manufacturers of carts may have put serial numbers on their carts, but might not have. If someone owns any carts by Broderbund, Fisher Price, First Star, Gebelli, Roklan, Romox, Sierra On Line, Sirius, or Synapse could you see if there are any serial numbers on these carts and email me what you find.

For those who are interested I also have lists of 2600, 5200 and 7800 games.

I would like to thank everyone who has contributed to this project. I was pleasantly surprised at the response to my request for help creating this list, and am indebted to the dozens of people who have sent me additions, corrections, and words of encouragement. As always I will be posting a new version of the list as soon as enough changes warrant it.

This ongoing C language conversation has caought my interest..How would one go about writing C code on an IBM and transporting it to the 8-bit? This could have some potential for broadening our software libraries. Is this a "do-able" thing? What kinds of pitfalls await me before I plunge into this?

Usually, all you need for a null modem connection is a cable wired so that the output of one computer goes to the input of the other and vice versa. Some computers might require the handshaking lines (DTR, RTS, CTS) to be connected a certain way; I don't know if the Macintosh does, but Atari doesn't. Other than that, you just need the proper connectors (25 pin, 9 pin, or whatever Mac uses). If the Mac and the Atari each have 25-pin modem cables, you should be able to just connect a null modem adapter between them. You might also need a gender changer.

Michael,

I also own Turboword+, and I agree, the editor is pretty horrible,
and there are very few printer features supported by it. Not enough
memory for large files to edit, editing is sometimes really slow, especially
when inserting or deleting stuff in the middle of a file.
I don't use AtariWriter 80 though, I'm a big Sparta-X fan and I've been
reluctant to use AtariWriter 80 because I understand there is no elegant
way to exit back to DOS. I did mean turbofile, when i mentioned it.
I wanted to get Turbobase too, but never could afford it, and now it's
too late. Turbobase is the mother of all databases, but I think even
Turbofile is one of the most complex next to its big brother.
It's got a few annoying bugs, and you really need a hard drive for it
(I suppose that would go triple for Turbobase).

No! Action! is a 'normal' programming language. Its paragon is C, but it
was created especially for the 8 bit ATARIs and their abilities.

227. Do an RFD: comp.sys.atari.advocacy?

Newsgroup: comp.sys.atari.8bit

Hi!
This discussion has been going on in the overly-active-of-late atari.st
section and someone suggested I'd better warn you.
Hopefully in the next week I'll be posting a Request-For-Discussion in
news.groups and all as below.

Until then, if you have any relevant comments you'd like to add then please mail
me at...

dxo@cs.bham.ac.uk

Thanks!

David.

------------------------------------------------------------------------------

REQUEST FOR DISCUSSION
======================

This is a request for discussion on the creation of a newsgroup for
debates about the Atari range of personal computers.

Group Name
==========
comp.sys.atari.advocacy

Status
======
Unmoderated

Rationale
=========
This group will separate a section of discussion from the current
newsgroup comp.sys.atari.st and atari.8bit.

The discussion of advocacy currently takes up over 50% of the items
in the atari.st newsgroup and so it is felt that the original
purpose of the newsgroup is being left behind.

New users and people who need information about the Atari ST can
continue to use the original group and would hopefully get more
```

attention if there is less advocacy mail present.

What a FAQ for this group could contain is also a matter for discussion.

Discussion
==========
Comments on this proposed new newsgroup should be posted to the USENET newsgroup news.groups. If the reader is not able to do so, comments may be e-mailed to any of the proposers, at the addresses below, and we will post them.

Voting
======
If no problems arise, voting will start one month from the posting date of this RFD.

Proposers
=========
David Oakley dxo@cs.bham.ac.uk
Ian M Rae imr@cs.bham.ac.uk
Annius V. Groenink avgroeni@cs.ruu.nl
Jan Kim kim@vax.mpiz-koeln.mpg.dbp.de

I've used my Mac with my Atari 800xl & 130 xe many times. I just simply
connected the Atari (with a p:r: connection) thru a null modem right into
a Mac modem cable that I got from Egghead. Then just run terminal
programs on each machine, and fiddle around with the settingd till they
work.

I believe I used Microphone on the Mac, and BobTerm on my 8bit.
Should be somewhat simple!

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <74523@cup.portal.com>
Source record: 108289

A little late, but I happened to be going through some old disk and
came accross somethiung I did a couple of years ago. I forgot the
exact setup the guy had, but it was something like a packet radio
hooked up to the joystick ports of an 800. He had a couple of AUTORUN.SYS
files or something that prevented him from setting the radio frequency
after the main program started<???@#$>. Anyway, with the ability of the
Atari to run initialization code I cooked this up for him. What happens
is when the file gets run (it was appended onto one of the existing
AUTORUN.SYS files), it sets up the joystick port to the frequency the
user wants, then returns control to DOS to continue loading the other
program(s). It's more quick & dirty then anything else, but it does
show how to use some floating point from assembly & put up a intro
screen. Let's see if Portal will swallow the U/L.

Body handling: Inline uuencoded payload not displayed: XON2.COM

Jeff....you mentioned that you didn't use Atariwriter 80 cuz
you were using Sparta X and "AW 80 doesn't go back to DOS" readily.
There is a solution I use AWP2DOS mod on it ....which puts XON2.COM
in place of MM.OBJ. If you don't use the mail merge data base you
can go right from the AW menu to dos by hitting [M]ove to DOS
instead of [M]ail Merge. The mod follows:
*****
Atariwriter Plus and Atariwriter 80 are great, simple-to-use word
processors. It frustrated me time to time however, that in order to leave
AW I had to reboot. It would have been so nice to be able to go to DOS
from AW's menu. Now I can! At the sacrifice of the "Mail Merge"
function on the menu, which I have rarely wanted to use, I have
substituted a "Move to DOS" function instead. Besides, I can use "Mail
Merge" if I want, by just putting away my modified AW copy and pulling
out the original AW master disk.

I AM NOT A PROGRAMMER, so no doubt, what I have done could have been done
more professionally by someone in the know. But maybe my modification can
be of use to someone else who has experienced the same frustration as
me.

REQUIREMENTS:

1. COPY of Atariwriter Plus or 80
(not your original, unless you
like living dangerously)
2. Any sector editor program
(e.g. DISK RX, ENHANCED BLACK
BOX, DISK IO)
3. DOS of your choice that will
run AW (I use SDX cart; will
work with SpartaDos 3.2,
AtariDos 2.5; I have not tried
with others)
4. For SDX users: XON2.COM
program (enclosed)

WHAT TO DO:

1. Load sector editor. Once loaded, insert AW disk. First we will change
the "LOADING MAIL MERGE" sign that appears when you press the Mail Merge
button in the AW menu. Go to the sector where that title is found, as
follows:
Atariwriter Plus (XL) = sector 161
(130XE) = sector 184

Atariwriter 80 (XL) = sector 133
(130XE) = sector 163

2. Now using the edit ASCII function, change the necessary
phrase. In AWPlus, the phrase will read "loading(heart symbol)mail(heart
symbol)merge". Change it to something like
"moving(heart)to(heart)dos(heart)(heart)(heart). All those hearts (by
typing control-comma), come out as spaces in the title when the program
is run. In AW80, the phrase is "LOADING MAIL MERGE". Change it to
"MOVING TO DOS ". Remember to put those 3 spaces (not hearts) in after
"DOS".

3. Now we will change the name of the program AW runs when you press
"Mail Merge". Go to the appropriate sector:
Atariwriter Plus (XL) = sector 167
(130XE) = sector 188
Atariwriter 80 (XL) = stay at
133
(130XE) = stay at
163
Edit the phrase "MM.OBJ" to read the name of the DOS you are using. DOS
2.5 users would type "DUP.S*". For SpartaDos 3.2, "X32D.*" Notice that
you are limited to six characters, so the wild card asterisk is useful.
SDX cartridge users must type "XON2.*", and be sure that they put
XON2.COM on their AW disk later. Likewise, everyone else needs to have
their particular DOS on the disk.

4. Now we will change the "Mail Merge" title as it appears on the
main menu. The sectors are:
Atariwriter Plus (XL) = sector 181
(130XE) = sector 122
Atariwriter 80 (XL) = sector 154
(130XE) = sector 173
The phrase to change is "ail Merge". Change it to "oving to DOS".

In speaking about using SDX and SD3.2 with AW, I have assumed that you know
how to run AW from each. SDX users must type "X AP.OBJ" on the command
line. The timedate line must be off. SpartaDos 3.2 users just type
"AP.OBJ" on the command line.

Feel free to pass this tip along. I got XON2.COM on a bulletin board
recently and it appears to be public domain. It had no author's name or
address on the docs. By the way, XON2.COM can be used to load SDX from
other DOSes, as long as the cartridge is in the slot though not in use.

George King
St.Catharines, ON

> /\/ /\ \/\/ / / / PhBill@Cyberden.SF.CA.US, or
> / / \/ / \ \ PhBill@Cyberden.UUCP

I have not laid eyes on an Atari DOS 2.5 manual in years. I quit
using Atari DOS the day I got MyDOS. I quit using MyDOS the day
I bought SpartaDOS X. I gave my sister all my documentation for my
old stuff and no longer have access to it. The SpartaDOS X manual
lacks in much Technical Detail and contains nothing about Binary Files
(that I could find, at least). So, in answer to you question.... NO.
Reading out of a book would have been just as easy as reading from a screen,
if I actually had one.

BTW- Speaking of incomplete documentation..... Has anyone gotten any closer
to figuring out the FE FF header in the SDX .COM files? I havn't played with
it in a while. It would be nice to be able write those totally relocatable,
memory resident, library sharing, etc., etc., files. To bad ICD still
won't give out any info.......

I have never actually seen it my self, but when I first heard about it, it was from a review. The reviewer claimed to be reviewing the Atari 8-bit version. I don't remember to magazine but I do distinctly remember the Atari 8bit being mentioned several times.

The reviewed game may have just been a 'review copy' of a version never released..... (par for the course, I guess).

From: A644690C@vax.edinboro.edu
Message-ID: <01GU2EQM3E5U9AMYB1@vax.edinboro.edu>
Source record: 108300

There is a version of SpartaDOS 3.2 called X321D.DOS. This 3.21d version
has been modified to allow more SDX/MS-DOS style commands. I found
a version on a local BBS but the file seemed to heve been corrupted.
Does anyone happen to have a copy of this? I would love to have a working
copy since going from SDX to SD3.2 can be a real pain when you forget
to type CWD instead of CD, etc., etc....

240. Re: C vs Action!

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-29 05:51:48 UTC
From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <74571@cup.portal.com>
Source record: 108302

Hmmm, hard to have an Action! conversation without me butting in <g>.

I asked Bill Wilkinson why they didn't come out with an Action! version
for the ST & he said, "Consider Personal Pascal the equivalent of Action!
for the ST."
IMHO: Action was meant to be a combination of the best parts of Pascal,
'C, & a macro assembler. As such it doesn't fully implement the style
of any one language, but it walks like a duck, quacks like a duck, & looks
like a duck =>? I know I'll do a BAD job of explaining it, but for instance
a macro assembler produces bloated code because everytime you use a macro,
it's expanded so you really want something that implements functions, like
GRAPHICS(0), as a subroutine. So, what the author did to get around this
was include a routine/procedure for passing parameters so the routine only
appears once. Looser/slower code then a macro assembler, but tighter
& completely transparent to the user. But he still left in the ability
to have machine language code embeded virtually anywhere in your code
as well as defining your own extensions to the language.
I almost think he thought Pascal was to confining in that it demands you
be obvious with your code & can't do anything "That may be potientially
wrong" while 'C allowed you to do write in such a shorthand method, that
no one could understand your code but yourself. A middle of the road
approach was needed that forced you to write organised code, but gave
you the freedom of 'C & assembly. A lot of the stuff that you find in
other languages, like garbage collection, was left out for the sake of
speed. I almost hate to admit it <g>, but Bill's only been coding in

Action! for a couple of months at the most, & I can understand EXACTLY
what he's doing. I can't even follow my own basic code. I also like
the Action! editor. I have Deep Blue & Lightspeed for my Atari &
Turbo Pascal (about version VI) & Turbo 'C for my clone. It's not even
close for how quick you can develop code. Unless you're ancient, like
myself, & grew up using Word Star on an IBM, pressing <CONTROL>Y to
delete a line is not at all intuitive or obvious. I'm sure you'll
bump into Pascal wienies bashing 'C wieniesabout the relative merits
of their languages & back and forth. Action! was just meant to address
the relative merits, but still be almost as fast as M/L. Unfortunately
a middle of the road approach was never done in the MeSsy DOS area.

This is from memory (a long time ago) the locations for the FDC are
at Hex 300 301 302 303 304 (see mapping the atari for more details).

There was a nifty utility allowed you set all the parameters ie
tracks sides sectors that you could format your disk with.
However a bit of hand hexcoding could do it easily except I forget
all the locations.

00 06 00 07 06 07 0a 01 00 03 0a 02 01 03 0a 0(forget the format byte)
02 03 and this is it if my memory of 7 years ago is correct.

Happy formating ..

244. 800XL As Car Computer

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-29 19:32:07 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9301291841.AA23932@smithkline.com>
Source record: 108206

Ah, geeze, I was hoping to stay away from this one but finally decided to pitch in my $.02.
If someone out there is REALLY SERIOUS about using an 800XL in a car, I'll send them a schematic for the power supply circuit. Dave Small had the same idea- he was gonna use his 800 (!), & also faced the power supply problem. I was rather amused that Dave Small, Boy Wonder who extolls the virtues of hi-tech in the pages of Current Notes & is best known for his digital wizardry with Spectre 3.0 & the 68030 accelerator for the ST, was totally stumped by what I regard as a trivial analog electronics problem. (Just goes to show, us old-timer analog guys are still good for a few things, the world will never be completely digital.)

Anyways, I'm of the opinion a 64K 600XL is preferable for car applications due to the smaller size- unless you need more memory.

As long as you run the computer from a car battery with the engine stopped, life is simple. A 7805 regulator, suitable heatsinked & decoupled, will do it.

The problems begin when you start the engine. Mama mia! Auotmotive alternators produce spikes the size of Goliath's spear. That stuff will knock a 7805 dead in no time flat (not to mention what the passed spikes might do to the XL). Then there are all the nice whopper-size inductances built into car electrical systems: wiper motors, heater/defroster blowers, carseat movers, electric windows, windshield washer pumps, ad nauseum, plus my own favorite: air conditioner compressor relays. Add to all that mess the fact that a car ground literally varies with the weather (the more so, the older the car). What you end up with is: voltage that varies +/- 20%, mammoth spikes on +V, AND monster spikes on the GND bus! That doesn't count RF from the spark plugs, ignition coil, & the car radio. Fun, fun, fun.

With a handfull of parts from Radio Shack you can tame it all. It takes a mess of diodes, a badnews resistor, an inductor & a potfull of capacitors- in addition to the regulator.

As with all such electronic gizmos, the problem is not the electronics per se but rather the packaging. The power decoupling circuit would have to be mounted VERY securely in a metal box somehow affixed to the innards of the car so it can't rattle around, & all the circuitry would have to be weatherproofed, but in such a way you can still get to it to repair it. This is a VERY tall order for the weekend solderjockey. I myself have done it, but I'll think long & hard before I do it again (my electronic installation outlasted the darn car!).

Unless you're prepared to do some serious metalworking, forget it.

For the record, it's been nearly a year since Dave small proposed his 8bit car project. Even with my decoupling circuit, he never completed it. (OK, to be

sure there were other factors involved in Dave's failure- his child was seriously injured in the car I think while he was working on it- but for whatever reason he never finished it.)

If I send my circuit to anyone, I'll expect in return a photo of the completed project, perferably accompanied by a manuscript publishable in AC.

245. 8-Bit DOS's

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-29 20:09:11 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9301291929.AA24219@smithkline.com>
Source record: 108207

This one is for Oliver Rosenkranz.
Yup, I think AC WOULD be interested in publishing a review of all the 8bit DOS software.

BUT... it would have to be an exhaustive article covering every known DOS. This sounds a bit tough, but understand our Utilities Editor has already published a similar review in Current Notes in 1991. Anything on this topic would of course have to pass his scrutiny, which means the piece would have to be better than the CN article. (Actually, on 2nd thought, Charles published TWO articles on 8bit DOS's. Hmmmm...)

SpartaDOS is a world unto itself & its weirditudes need to be rigorously documented, as it has generated some fierce factions within the community. I would especially like to see performance comparisons of Sparta vs. MyDOS on hard drives. There seems no middle ground on Sparta; people either love it or despise it.

I don't think anyone even knows how many different ones there are. Perhaps that is where this forum could be most useful: as a starting point, how about all yooze guys sending in lists of DOS's you've used, & someone merge them to make a master list. In the articles published by Charles Cole, he covered only the major ones, & some of those rather scantily. When the list is finished, then maybe Oliver can decide if it's still something he'd like to tackle.

To get the ball rolling, here are the DOS's I presently own:

AtariDOS 2.0s
AtariDOS 2.5
DOS XE
DOS XL
OSA+
BlackDOS (AtariDOS 2.6f)
MyDOS 4.50
SpartaDOS 2.3e
SpartaDOS 3.2d
SpartaDOS-X 4.20

That's 10 DOS's just off the top of my head. I know there are at least TWICE this many. (I used to own AtariDOS 3.0 & THREW IT AWAY; it was trash to start with. The PD is littered with DOS software, BlackDOS is one of those. Then there are various imports: SuperDOS, TopDOS, & gosh knows what else, but I can't verify their existence.)

Action! is a structured language resembling Pascal, but without the semicolons.
The cover of the manual has a yellow diagonal band in the upper left with the
legend "FOR ATARI", which implies perhaps it was available on other systems.
Perhaps the C64? It is very fast, but only does integer math, and usually
requires the Action! cartridge.

247. Re: 8-Bit DOS's

>published a similar review in Current Notes in 1991. Anything on this topic
>would of course have to pass his scrutiny, which means the piece would have
>to be better than the CN article. (Actually, on 2nd thought, Charles published
>TWO articles on 8bit DOS's. Hmmmm...)
Thank you, Ben, for your reaction on my posting...
As you said, several articles concernig SpartaDOs & MyDOS already exist.
This is because they were/are US products and most of ATARI related publica-
tions come from there.
My interest is not to remix this SpartaDOS/MyDOS knowledge (that would be
a crazy task). I want to cover a worldwide bandwith of DOS variants.
This will be no article to do diagnostics on each of those DOS but to summary
all the MAJOR features of the DOS versions so that the USER is able to decide
which DOS he wants to use (or get and take a look at it).
You are right to say, that SpartaDOS needs a good documentation, but this is
not the job, I want to do.
I am an European (German) ATARI user, so I'm not able to review all the US DOS
versions as good as one of you guys would be. I don't even use a hard disk.
But -be honest- ATARI XL hard disk users are the minority. In Europe there
are just a few ones. If someone wants to take a close look at this aspect ...

I want to try to give the 'normal' use some help. And I think this is what
ATARI Classics has to stand for (or subscription quote will go down rapidly).
I don't want to tell you what you have to do.
Just read my article and decide whether you want to publish it or not.

>I don't think anyone even knows how many different ones there are. Perhaps that
>is where this forum could be most useful: as a starting point, how about all
>yooze guys sending in lists of DOS's you've used, & someone merge them to make
>a master list. In the articles published by Charles Cole, he covered only the
>major ones, & some of those rather scantily. When the list is finished, then
>maybe Oliver can decide if it's still something he'd like to tackle.

YES, I need the help of ALL of you to do it. But it is not enough to mention,
which DOS you know and which one is the best for you.

If you read my article and see, that YOU have DOS which is not on my list
examine your DOS and write down the facts which are neccessary to put it on
the list. Then send these facts to me (rossi@cs.tu-berlin.de) . I will put
your name to the list of supporters and add the DOS (or details of one of them)

to the list. If you are consequential, it will work.

--==rossi==--
Oliver Rosenkranz

(Hmm, I thought, that I already posted this list but I didn't see it here, so I will post it again. - Thank you for all those guys writing me.)

248. Hobbytronic-Demo '92 at the archive

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-30 13:58:31 UTC
From: uj1g@ibm3090.rz.uni-karlsruhe.de
Message-ID: <uj1g.24.728402311@ibm3090.rz.uni-karlsruhe.de>
Source record: 108210

Hello,

some days ago I've uploaded two files called HOBBY92A.DCM and HOBBY92B.DCM
to atari.archive.umich.edu. You can find then with a short blurb in the
8bit/Demos directory.

This files contain both sides of the Hobbytronic-Demo '92 disk.
The Hobbytronic fair is the most important fair for the 8bit Atari community
in Germany.

The 8bit user club called ABBUC compiled this demo disk for the last year's
fair.

You can find some very nice programmes on this double-sided boot disk.
A note: In order to advance to another parts of the demo, always press the
START-key.

Have fun

Marek Tomczyk

DOS overview

by Oliver Rosenkranz version 1.01

Many Thanks to all the guys who supported me :

Jerry Dunham (dunham@devnull.mpd.tandem.com)
Frank E Seipel (fseipel@magnus.acs.ohio-state.edu)
Michael Current (currentm@carleton.edu)
Winston Smith (winston@merk.com)

last edit: 30st of January 1993
=-=-=-=-=-=-=-=-=-=-=-=-= Version 1.00=-=

DOS - Disk Operating System

No ATARI 8 bit computer (the original ones) have an operting system onboard
which is able to control/use a disk drive. This is because (a) ATARI computers
have be developed in the 1970s when diskette technology was expensive,
(b) such a DOS needs lots of memory which programs loaded by cassette can use,
(c) ATARI didn't want to waste ROM (ROM was expensive, too), (d) a ROM-
installed DOS would have set the standard of 1970s-software for the '80s and
'90s (with their further hardware developments).

So, ATARI decided to give the user a disk-based tool named DOS.
And because of this decision DOS 1.0 found its way to the ATARI community.
But this tool was full of bugs and was not very user-friendly.
So ATARI and others began to write new DOSses for the 8 bit and through the
years new disk drives and floppy speeders gave the ATARIans a desire for
better software to take full advantage of their hardware.

Now, in 1993 the number of different (?) DOS variants has been increased
in a way that the 'normal' user isn't able anymore to overview them.

I don't want to begin a never-ending discussion about the best or worst DOS
ever published. Every user has its special interests and hardware configura-
tions, needs other features and has his own requirements to a DOS.

I hope that I give YOU (whether you are an ATARI enthusiast or novice user)
a little help and/or guideline through this jungle of different programs.

It's a matter of fact that I can't neither own all the DOS versions ever pro-
duced for the 8 bit nor know all the features a every DOS offers.
So, if you're missing a DOS or even a fact here, don't flame me but send me
a mail (rossi@cs.tu-berlin.de) telling me about it. Write down all the details
you did't see here and I will write them down and add them to the list.

I NEED YOUR HELP AND SUPPORT IF THIS ARTICLE SHOULD BE A HELP FOR OTHERS.
Thank you in advance.
--==rossi==--

DOS XE ???

But statistics isn't all....

Here are the features the DOS variants are standing for...

```
================================================================================
DOS 1.0 -devine device -full of bugs
--------------------------------------------------------------------------------
DOS 2.0S -standard -not very user-friendly
-doesn't allow lower-case filenames
(There are a lot of hacks of this DOS out there.
One of it allows lower-case-filenames, I don't
wanna mention all of them here, if they are only
a few-bytes-changed-version of DOS 2.0)
--------------------------------------------------------------------------------
DOS 2.0D -like DOS 2.0S -for use with ATARI 815 disk
drive
--------------------------------------------------------------------------------
DOS 2.5 -better than DOS 2.0 but not really user-friendly
--------------------------------------------------------------------------------
DOS 3.0 -uses system files -not kompatible to DOS 2.5
-convert DOS 2 -Files -online help
-create your own commands
-supports 130XE's RAMdisk
--------------------------------------------------------------------------------
DOS 2.5m -like DOS 2.5 but without the need to press RETURN
after the command letter
--------------------------------------------------------------------------------
DOS II+/D 4.3M -clear disk (delete files & new dir)
-diskname
-mini ml monitor (mem-dump,mem-change,show registers)
-12KB RANdisk (build-in,M: $5000 - $7F00)
--------------------------------------------------------------------------------
DOS II+/D 6.1 -like version 4.3M
-other features ???
--------------------------------------------------------------------------------
Happy DOS 1050 -1011 free sectors (1010 are normal)
-revive file -no RETURN after command
--------------------------------------------------------------------------------
FunnyDOS 3.0 -931 free sectors -drive speed test
-radix convert (hex,dec)-check sectors
-copy sectors
(DOS 2.9 is like this one but with a black background)
--------------------------------------------------------------------------------
DOS 2.6f -like Funny DOS 3.0 but only 707 free sectors
(for ATARI 810 users)
--------------------------------------------------------------------------------
K-DOS -uses system files -revive file
-ml monitor (procede,examine,alter register)
-boots system if RESET is pressed
-kill -UDC
--------------------------------------------------------------------------------
DOS XL 2.20 -uses system files -optional DOS 2 like menu
-other features ???
```

```
--------------------------------------------------------------------------------
DOS XL 2.30 -uses system files -debugged DOS XL 2.20
-other features ???
--------------------------------------------------------------------------------
Top-DOS .2 -undelete -create your own commands
-ml monitor (read,edit) -bypass-cartridge (choosable)
-set left margin -Auto-RS232 (choosable)
-system drive# -number of buffers
--------------------------------------------------------------------------------
Top-DOS 1.5a -like version .2
-choosable RAMdisk#
-set time-out -error list
-online help -number conversion
--------------------------------------------------------------------------------
SpartaDOS 1.1 -diskname -uses system files
-sub-directories -not compatible with DOS 2.5
-different dir (name,bytes,date,time)
-undelete -system clock
--------------------------------------------------------------------------------
SpartaDOS 3.2c -like version 1.1 -extra date/time line
-easy multifile copy -various disk init formats
-speed check -sector copy
-takes advantage of some disk speeders
-supports hard drives (up to 16MB per partition)
-supports batch files -RAMdisk support
-128 files per (sub-)directory
-different copy system-files (chaotic)
-GAME-DOS (run program with key-press)
-DOS menu choosable (file-selector-box)
-supports R-Time 8 cartridge (ICD)
-32 character-keyboard buffer
-many driver for communication devices
-set number of buffers -check disk
-works only with XL/XE computers (1.1 for 800 users)
--------------------------------------------------------------------------------
SpartaDOX X (SDX) 4.19 -not disk-based but cartridge-based
-uses no user-RAM -accepts 1-9 or A-I as drive
specification
-high speed possible -choose between ATARI format
mode and SpartaDOS mode
-diskname -medium density choosable (still
incompatible with DOS 2.5)
-supports most kind of RAMdisks & disk drives
-XEP 80 driver -arc/unarc function
-you can still use other cartridges
-basic on/off -most features of version 3.2d
-otpional directory format (with date/time or without)
-print files -alphabetical sorted directories
on screen, not on disk
-sort option choosable -prompt character choosable
```

```
-swapping drives -unerase files
-X command (turns cartridge off - power-up to return to
DOS)
-is not 100 % compatible with all software (only few
programs won't work)
-can't be copied to a disk
--------------------------------------------------------------------------------
MultiBoot XL! 4.0 -not really a DOS but a disk/cassette-copy/load utility
-not compatible with DOS 2.5
-it options : write MB4.0, load boot prg cass/disk,
write boot prg cass/disk, copy file
rename file,sector copy,format disk
delete file
--------------------------------------------------------------------------------
SmartDOS 6.1D -copy sectors -test sectors
(RANA-DOS) -speed check -easy to use
--------------------------------------------------------------------------------
SmartDOS 8.2D -like version 6.1D
-less memory needed -other features ???
--------------------------------------------------------------------------------
OS/A+ V.2.00/4 DOS -uses system files -predessor of DOS XL
-other features ???
--------------------------------------------------------------------------------
MyDOS 3.013 -drive configuration -choose system drive#
-directory name
--------------------------------------------------------------------------------
MyDOS 4.50d -like version 3.013 -supports hard disk up to 16MB
partitions
-subdirectories -disk directory by typing in a
number
-copy sectors -takes advantage of some disk
speeders (high speed)
-subdirectories have to be specified in program-
integrated filename specifications
--------------------------------------------------------------------------------
MyDOS 4.53 -same features as version 4.50d
-can handle multiple AUTORUN.SYS files (*.AR1 - *.AR9)
--------------------------------------------------------------------------------
XL-TOS 1.0 -uses windows,icons,pull-down-menues
-no wrtieTOS,save file,copy file/disk, go address
feature
--------------------------------------------------------------------------------
G.O.S. 1.3 -uses window/icons/pull-down-menues
-sub-directories -change colors
-directory name -disk name/drive name
-print file -edit file
(This is not the Diamond OS !!!!)
--------------------------------------------------------------------------------
MachDOS v2.6XL -choose system drive# -convert files
--------------------------------------------------------------------------------
```

```
BiboDOS 5.4 RN -good RAMdisk support -easy to use
-configuration (#of buffers, RAMdisk resident?,
RAMdisk?,keyboard buffer?)
-startup edit -1011 free sectors
-undelete -dir when number-key is pressed
-supports XF551
------------------------------------------------------------------------------
BiboDOS 5.4 RF -like version 5.4RN -supports several disk speeders
------------------------------------------------------------------------------
BiboDOS 5.4 RN/XF -like version 5.4RN -especially written for XF551
users
------------------------------------------------------------------------------
BiboDOS 5.5 RF -like version 5.4RF -BASIC on/off
-clear disk -show file
-special configuration (repeat frequence,wait time)
------------------------------------------------------------------------------
ANTIC! DOS 4.0 ???
------------------------------------------------------------------------------
1050 Warp Speed DOS 2.0 -like DOS 2.0 -supports warp speed
------------------------------------------------------------------------------
Action! DOS -like OS/A+ DOS -dir shows a line '# of files'
------------------------------------------------------------------------------
GEM-DOS -uses windows,icons,pull-down-menues,icons for files
-full of bugs
------------------------------------------------------------------------------
DOS IIs -like DOS 2.0 -special copy routine
------------------------------------------------------------------------------
Turbo-DOS XE V2.0 HS -short info about all commands (without disk access)
-uses system files -show/edit system variables
-radix convert(hex,dez,ATASCII)
-hexdump/edit -BASIC on/off
-recognizes automatically the density of the disk
-look at load/start addresses/areas of files
-get file checksum -show files
-clear dir -give command chain to cartridge
-write fileloaderDOS to disk (GAMEDOS)
-batch files -disk copy with density-mix
-supports disk speeder -complex but easy to use options for most commands
-online help -support for XF551
------------------------------------------------------------------------------
DOS XE -supports XF551 drive -version of DOS XL (???)
---------------------- without any guarantees -------------------------------

This list is incomplete. To make it more complete and help all users to
choose between DOS variants, please check out this list for failures or/and
lecks of information. If you find some facts I didn't pay attention for,
drop me a line via email (rossi@cs.tu-berlin.de) and I will update this list
and put your name to it, if the hint is new to me/the list.
Even if you have a new DOS or another DOS version you don't find on this list
gimme a description of it with all the facts you know about it which are impor-
```

tant for the list...

Thank you in advance
--==rossi==--
Oliver Rosenkranz
rossi@cs.tu-berlin.de

I would thank anybody giving information (for this list) to me about any of
these DOS variants :

- Super DOS (Australia)
- Dutch DOS
- DOS XE
- G.O.E.
- MyDOS 4.53
- SpartaDOS X
- mini DOS
- and others .....
- ANTIC!s DOS 4.0

Please notice that (summarizing features is quite nice, but since I don't own
all of those DOS versions, I can't get any info for myself.
Please look into this list and see, what needs to be added to this list in
detail (also the statistics !!).
---

Joe, I can't WAIT to try this! Like Jeff, I find it annoying that I can't get back to SDX from AW80. Though unlike him, I decided I could live with it.

I'll let you know when I give the mod a try.

In a previous article, bbs@neb (BBS System 801-572-4969) says:

>Why use _ANYTHING_ else when Textpro exists? _THE_ editor for the 8bit
>Atari! (griN)

Does Textpro run on the XEP80, run under SDX, take advantage of XE memory
for text buffer space?

Seriously, I don't know how Textpro compares to the others, but I'm curious.

No, it was only ever available for Atari. The yellow band is no evidence - you always label software (and firmware) after which computer it runs on, whether it's available for other computers or not...

> Perhaps the C64? It is very fast, but only does integer math, and usually
> requires the Action! cartridge.

You can (or you could at some point) get a run-time library. I've seen PD software written in Action! running without the cart.

Gee, that's too bad; it's a well designed package, and one reason I bought
Personal Pascal when I got an ST.

Yeah, that's why I said 'usually'; I have no idea if the run-time library is
available anywhere, even though the cartridge & manual package may be.

254. 'nother 8-bit source gone?

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-30 21:33:47 UTC
From: wilmott@remus.rutgers.edu
Message-ID: <Jan.30.16.33.46.1993.28024@remus.rutgers.edu>
Source record: 108216

Just thought I'd pass along this bit of info -

Got a catalog update from Bellcom today. It is stated on the inside cover that over the past year 8-bit orders have drastically dropped. The owner is giving the 8-bit community one last chance - if enough orders are not received by April 30th, Atari 8-bit support will be dropped. So if you've been considering picking up some new stuff for your 8-bit, now might be a good time...

-Ray

255. Bill Wilkinson

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-31 04:33:05 UTC
From: withers_n@kosmos.wcc.govt.nz
Message-ID: <1kfkq1INN1j9@golem.wcc.govt.nz>
Source record: 108217

Does anyone in this group know if Bill Wilkinson is available anywhere ?
He used to write the 'Inside Atari' column in COMPUTE.....one of the
main reasons i bought the mag.
I have translated his program 'Base Converter' to Commodore Basic (I
know I'm a traitor but the C=128D takes a lot of beating!)
As I think tha this is an interesting program I was thinking of putting
it on an FTP site.
I don't know if Bill would have any objections or if it is copyright
to COMPUTE.
Any information please let me know.

Thanks,

Nick Withers.

>is simple. A 7805 regulator, suitable heatsinked & decoupled, will do it.
>
>The problems begin when you start the engine. Mama mia!

Noise from a running engine can definitely be a problem, but it's not
that hard to solve. I use a heavy duty voltage regulator that outputs
3 amps at 5VDC (I think the 800XL needs only 1.5 amps), and the most
important noise suppression I use is a 6500 microfarad capacitor (it's
about the size of a D-cell battery) on the output side of the
regulator. I also use small capacitors at the individual ICs on my
home-built parallel bus device. I haven't found the need for special
shielding or anything like that, and my car is a 1964 Plymouth that
produces *lots* of electronic noise.

If you keep the equipment inside the car weatherproofing isn't
important, and it only needs to be mounted firmly enough that it stays
where you want it when you drive down a bumpy road or take a fast
corner. You'd be amazed at how rickety my setup is (I sure am)!

Are we talking about the Compute! one where he gave a number in base x which happened to be a word, and said that the same number in base y was another word? If so, did you get it? It's been annoying me ever since...

> As I think tha this is an interesting program I was thinking of putting
> it on an FTP site.
> I don't know if Bill would have any objections or if it is copyright
> to COMPUTE.

ALL programs that were printed in Compute! had (c) symbols all over them... I think they also had a small info-page for contributors with restrictions and copyrights for the programs. On the other hand, if you just ripped (;) the algorithms and not the source, you should be okay... I think. Unless OMNI is owned by Apple.

> Any information please let me know.

And speaking of Bill Wilkinson, what happened to OSS? I assume they packed up at some point, but when?

258. DOS (cough...) XL files

Newsgroup: comp.sys.atari.8bit
Date: 1993-01-31 05:58:53 UTC
From: donor@max.u.washington.edu
Message-ID: <1993Jan30.215853.1@max.u.washington.edu>
Source record: 108220

I am having trouble with some .COM files that will only execute from DOS XL.
I do not particularly enjoy using this DOS, and would like to load the programs
from MyDOS or such. Does anyone know the format of a DOS XL .COM file?
I suspect it is very similar to the Binary Load format that has been tossed
around this newsgroup recently, since the unexecutable files will load without
error from a real dos... They just will not run.

James Evans, Nuclear Physics Lab, University of Washington

No, yes, and yes. Using XE memory, you can have three separate 16k buffers and use the rest of the extra memory for ramdisk. It also "knows" about subdirectories in Sparta or Mydos.

I doubt Compute! would really care any more... They haven't printed a
program since April 1988, and didn't seem too ripped when Antic accidentally
ran Biker Dave as a disk bonus.

>And speaking of Bill Wilkinson, what happened to OSS? I assume they packed up
>at some point, but when?

I think they also packed up in '88 or '89; I read about it in the ST
section of Compute! while waiting for my subscription to lapse. Something
about Wilkinson being "sick of it" and going off to program in some AI language
for who knows what.

If I remember correctly, OSS was absorbed by ICD, who only dropped
8bit support last year or the year before, but said they would license the
stuff to anyone that made them a reasonable offer.

James,

If you can, look though last weeks postings considering file headers, they
will give you some information that you are looking for. What I think happens
is, if DOS XL doesn't see a RUN address, it defaults to executing the
file at the first load address it was given. MyDOS and othe AtariDOS
variants I am supposing don't seem to be that smart. So you need to
at that RUN address to the end of the file. If you can dig up the
file header information recently posted, you should be in good shape.
If you are still having problems, feel free to e-mail me.

>and use the rest of the extra memory for ramdisk. It also "knows" about
>subdirectories in Sparta or Mydos.
>
>Bill Marcum bmarcum@world.std.com
>
>
I'd like to add to that if I may. The last comment referst to Textpro being able
to search your "PATH" for all it's needed files.
So even if you are working on your hard drive in a subdirectory

D3:Utilities/arced/sparta/

and Textpro is located in:

D4:apps/tpro/

as long as "D4:apps/tpro/" is part of your path setting, you can be anywhere,
and do something like :

-tpx SDVERT.DOC

SpartaDOS will automatically look for the TPX.BAT file, execute,
and Tpro will look for all it's support files, and then load in
SDVERT.DOC automatically. It's pretty darn powerful. Almost makes you feel
like you're using UNIX or MS-DOS. Especially if you are using a Hard Drive,
or some high capacity disks like 360K or 720K where you might have files
buried several subdirectories deep to keep things organized. In such
cases, not having to worry where your Editor, or any of your other
.COM files for Sparta is a real convenience. One of the big reasons why
I still stick to SpartaDOS X and haven't moved to MyDOS. You just can't do
those sorts of things with MyDOS!

Welp, I need the money so saddly some Atari Stuff Must Go.

OSS Action! Cart, Docs and the works, just had the cart repaired by OSS for $30 bucks last year. So for $32.50 (s&H) its yours in an ICD box none the less!

1020 Plotter, dont work, never did. I bought it new for $29.95 some years ago and never returned to the mail order place. Nearly factory new. Best Offer.

Books, Abunch of them Mapping the Atari, ML for Beginners, Compute!'s Atari series 1 and 2 and the Compute's Atari Basic Source Book. Hey take them off my hands for $5 bucks each or $20 bucks carries it all and a mystery surprise!

ElectroCop for the Lynx! Wow $10 bucks including Shipping. Box & Dox

Todd's Adventure In Slimeworld $25 bucks including Shipping. Box & Dox.

Non Atari Stuff

Sega Master System, Alex Kidd: The Lost Stars; Box Dox and All $15.00 including S&H. Play it on your game gear, wow what a deal.

Sega Master System, Alien Ayndrome $15.00; Box & Dox
Sega Master System, Space Harrier 3d $15.00; Wow! includes 2D mode!; B&D.
Sega Master System, AstroWarrior $15.00; Kill. Them. ALL. B&D.

MS DOS, Operation: Combat; Computer War Simulator
$10.00 box,dox and 3.5 or 5.25
MS DOS, Obliterator from Psygnosis $10.00 box & Dox 5.25

Wow what a deal. Make an Offer, any offer at all.

Source record: 108237
Cross-posted to: ont.micro,kw.micro,comp.sys.atari.st,comp.sys.atari.8bit,uw.sys.atari

In February, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Printing Tricks.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the January issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, February 10, 1993
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

I have the following Atari 8-bit hardware and software for sale:

Hardware - 1050 Disk Drive with US Doubler
1020 color pen plotter/printer

Accessories - 5 joysticks
1 set of paddles
1 ICD printer cable
1 ICD modem cable

Software on disk - SpartaDOS 3.2d
Bank Street Music Writer
The Converter version 1.51
Paper Clip
Print Power
The Print Shop
RAMbrandt version 2.0

Games on disk - Alternate Reality - The City
Alternate Reality - The Dungeon
Artic Antics
ballblazer
Boulderdash Construction Set
Chessmaster 2000
David's Midnight Magic
F-15 Strike Eagle
Hacker
Jawbreaker
Jewels of Darkness
Leaderboard Dual Pack
Master of the Lamps
MRCA Mach 2
Pinball Construction Set
Quest of the Space Beagle (no docs)
Silicon Dreams
Tail of Beta Lyrae
Temple of Apshai Trilogy
Gateway to Apshai
Trail Blazer

Books - Basic Atari BASIC
De Re Atari
Mapping the Atari, revised version (includes XL stuff)

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: May, July, Aug/1985

May*, June, Dec*/1987
Feb, Apr, Nov*, Dec*/1988
* these issues include the disk

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

I don't have any specific information but I think the following Hobbytronic fair 93 should take place around March/April/May. Provided I find out in which city it takes place and provided I have some spare time, I'll try to go to this fair and get the recent demo. As soon as possible you'll find it at a.a.u.e.

I don't know how many of these demos are around, I guess there should be a few of them. This 92 demo is the only one I have.

Does anybody happen to have another H.T. disks? Could anybody upload them to the archive? Thanks!

Well Bill still lived in Cupertino, CA a couple of years ago, as I used to run into him from time to time in a somewhat unrelated context (we were both taking Mountain Dulcimer lessons - we never talked computers although I knew who he was). But I'm afraid I don't know what he is up to these days.

279. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-01 21:29:41 UTC
From: CURRENTM@carleton.edu
Message-ID: <01GU7NEO9UZ68Y5511@carleton.edu>
Source record: 108241

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 18-Jan-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current, currentm@carleton.edu.

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many of the
most commonly asked questions related to the 8-bit 800/XL/XE series of Atari
computers. This saves the veteran members of this discussion group
considerable time and effort answering the same questions over and over again.
At this time the FAQ List is heavily geared toward describing the various
resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

This type of discussion: Belongs in this newsgroup:
ST/TT/Falcon comp.sys.atari.st
Portfolio comp.sys.palmtops
Lynx, 2600, 5200, 7800 rec.games.video

(In terms of compatibility the XE Game System is really an 8-bit Atari
computer, so if you ignore its marketing as a game console its discussion
belongs on comp.sys.atari.8bit.

The 5200, while externally incompatible with the 8-bit computers, is internally
very closely related. Therefore, 5200 discussion may also be relevant on
comp.sys.atari.8bit.)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the
Internet side of this discussion group. All contributions to the Info-Atari8
Digest automatically appear on Usenet's comp.sys.atari.8bit.
To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu. (The list is maintained by John
Dunning, jrd@stony-brook.scrc.symbolics.com.)

To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to Info-Atari8@naucse.cse.nau.edu will not be cross-posted to the Usenet side. John Dunning would like to fix this, so if you are an accomplished UNIX programmer please contact him.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. The moderator of 8-bit Atari files is John Dunning, jrd@atari.archive.umich.edu, while the Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.
atari.archive.umich.edu is mirrored at the following 2 sites:
wuarchive.wustl.edu in the mirrors/archive.umich.edu/atari directory, and
src.doc.ic.ac.uk in the packages/atari/umich directory.
For downloading by FTP, the above mirror sites are functionally equivalent to atari.archive.umich.edu.

How do I download files from the Archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu (141.211.165.41), login as "anonymous" and type in your e-mail address as your password. Now type "cd atari/8bit" to reach the 8-bit directories. If this is your first visit to the archive, be sure to download the file -read-.-me-. Other files of general interest are 8-bit.cat, containing 1-line descriptions of all the files available, and 8-bit.text, which contains paragraph-long descriptions. Be sure to have file-type set to BINARY when downloading binary files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is atari@atari.archive.umich.edu. If you are a first-time BART user, send it a message that says:

```
help
send 8bit/-read-.-me-
send 8bit/0index
```

If you receive nothing within a day (it should take just a few minutes), include this line:

```
path {your mail address here}
```

This allows you to tell BART exactly where to mail the files requested. This can be useful for UUCP and other addresses that BART may not be able to figure out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other files of general interest are 8-bit.cat, containing 1-line descriptions of the files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.165.41), login as "anonymous", type in your e-mail address as your password, and then type

"cd atari/8bit/New". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should only be posted to the discussion group as a last resort.

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to access any files available via anonymous FTP on the Internet, including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of your message says:
help

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made availble to people with email or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts

are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network. Send correspondence and press releases to xx004@po.cwru.edu.

What magazines support the 8-bit Atari?
Atari Classics (exclusively 8-bit) Classic 8-Bit Atari (disk only, games)

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion

program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. A newer (better?) uuencoder/decoder is contained in the file 8bit/Utilities/uue.arc. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen

display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari BBSs and 8-bit Atari user groups, each of which is too long to include here. Contact him at 71450.1050@compuserve.com.

End of FAQ list.

>the C-64. It's interesting to see 6502 assembly language listings in a 1993
>magazine, though...

What?! I haven't checked out Compute! in years; I ditched it when they dropped the 8-bit line and stopped running program listings. Why would they be running 8-bit program listings now, in a day and age where few people are willing to spend the time to type in lengthy programs?

I may just have to hit my local news stand and check this out.

281. For Ben Poehland

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-01 22:55:55 UTC
From: Dawn_Scotting@kcbbs.gen.nz
Message-ID: <1029331.82555.4820@kcbbs.gen.nz>
Source record: 108243

To: poehland%phvax.dnet@smithkline.com

Sorry about this folks!
Hi Ben, I still can't send email to an address with a '%' in it! I just wanted to let you know that my copy of Atari Classics arrived okay last week. It took two months to the day from the postmark date, I guess that's not too bad for surface mail! You and all the team have done a fantastic job with it and I am very impressed. Did you get your required 500 subscriptions before the end of 1992 at all? Is it possible for you to find out how many from NZ have subscribed and to let me know? I would like to inform them of my access to the net in case anyone would like to write an article, although getting blood out of a stone would be much easier! Keep up the good work.
Cheers.....Dawn

| PLEASE READ THIS----As I must pay for every byte of email received |

OSS was bought by ICD and they are not handling 8bit stuff anymore.
Wo no more OSS stuff either.
Compute! released the rights to their software to GEnie ei. then
it is PD also and can be used without reprisal or donation.
BTW: in the end, the ONLY reason I read Compute! was for Bill's
articles.

283. Alternate Reality PROBLEM!! Need help!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-01 23:34:34 UTC
From: oberland@vax.sonoma.edu
Message-ID: <1993Feb1.153434.1@vax.sonoma.edu>
Source record: 108245

I was wondering if anyone could help me.

This is thecnically a MAC question, but as this is the ONLY place that
seems to still know about Alternate Reality, here goes.

I have AR for the MAC , and , alas, it comes on one of those OLD custom-systems
that made DarkCastle and such run.

I got a new machine, and it will not run anymore.

COULD someone help me, or better yet, since the source-code is somewhat
available, could the author possibly see his way to helping me out so that
I can get it running again?

Thanks.

Oberland@vax.sonoma.edu

284. Re: Textpro

Newsgroup: comp.sys.atari.8bit

Message-ID: <s2HByB6w165w@cyberden.sf.ca.us>
Source record: 108246

Yes, Textpro does do RAM banking. So far 4.56 does only 4, right?
(someone correct me if I'm wrong), but I do do remember hearing that 5.0
will do as many as you have.

I'd like to figure out how to make my extra 192k RAM be part RAMDisk and
part TextPro (or something else) banked RAM...

is this possible!?!?? Hmmm

Re: can (could) get run-time library.

Well, I have the PD RunTime package for Action! which does everything but the Break() library (who needs it? :)). Anyways.. it even has a file called RTSCAN.COM (and it's sourcecode!) that will scan a ".ACT" Action! source file and tell you (in order that the PD RUNTIME.ACT INCLUDE file has them!) what procedures you need... even the ones used by other ones (like the "_xxx" ones which are "system" procedures... used by other procedures to get THEIR jobs done)

cool, eh?

I do sometimes have problems getting stuff to run, but I most likely ruin things when editing down the original RUNTIME file..

Well, I've been put wrong (off by one, actually). And also how exactly
do you get MyDOS to work around TextPro with extra RAM? (I have no TP
docs... lazy and waiting for 5.0 (non beta) to come out)

THat other person's trouble with DOS XL COM files not running under, say, MyDOS may be fixable with a SpartaDOS COMmand (perhaps it was file, perhaps it was simply internal.. not sure.. I only have the docs to it in the SDConst.set manual). It puts a run address (???) on the file to get it to work with Atari DOS.

I'll just guess that DOS XL acts like SD in this way (no RUN addresses)

I dunno what I'm talking about, actually.. :) Someone'll help out.

Just a suggestin!

In a previous article, phbill@cyberden.sf.ca.us () says:

>Yes, Textpro does do RAM banking. So far 4.56 does only 4, right?
>(someone correct me if I'm wrong), but I do do remember hearing that 5.0
>will do as many as you have.
>
>I'd like to figure out how to make my extra 192k RAM be part RAMDisk and
>part TextPro (or something else) banked RAM...
>
>is this possible!?!?? Hmmm
Bill,

Textpro only does 3 windows, the main bank, plus two more 130XE banks.
Textpro 5 will not have additional banking support added in, Ron says
he only has a 130XE and with all the different modifications out there,
he didn't want to mess with it himself. But he did say on the phone with
me a week or so ago that theoretically you could support at least 26 banks
of 16K each.

With SpartaDOS X, and Sparta 3.2d, I keep the 130XE banks clear, and use
the other 960K of my 800XL as a huge Ramdisk. Programs like Textpro are
free to use the 130XE banks without causing any harm to the Ramdisk.
Doing a similar thing with MyDOS requires putting in the banking codes
by hand when specifying a Ramdisk with the O option.

That demo was nice! Biggest scrolling text >I've< ever seen. Great
graphics and the such.

One questions...
is it the fact that my mom picked up the phone during D/L
or is it just an NTSC vs. PAL problem:

The one demo one the "b" side of the Hobby92 disk .. the one with the
camel.. is WAY screwed up. Well, at least it doesnt crash.

Re: Other HobbyTronic demos and H.T. (H.T.T.?) demos.

(I'll assume you mean "high tech team" when you say "H.T.disks"...?)

These guys are great. It seems that the majority of demos of this calibure (HTT "BIG DEMO" and "Hobbytronic-92") are written in ATMAS II. I've seen ATMAS (I) advertised in Best or somebody's catalog (not sure who), and I'd like to see this version 2 of it. It might be the way to go when programing speed intensive programs such as these demos.

BTW: Anyone out here in the US (with NTSC.. USA is the only, isn't it? Is Canada PAL?)... anyways.. Anyone have trouble seeing that "camel"/"rock-band" demo? (The 2nd one on side B) I'm sure it looks fine (and AWESOME!) on your system, Marek.

I wonder if anyone'll be writing articles on all of these demos for _AC_]

Oh yeah. You all know about the "DEMO8PL.COM" on side B of the Hobbytronic-92 disk, right?

I wonder. How the HELL >did< he get 8 players in one scan line with that quality!?!?!? I mean, NO flicker at all! Even on an NTSC!!

Jeez.. At first I thought 8-player mean as in voices (like "FOUR-TRACK" from France) or songs, but then I noticed "hey, those letters are multicolored, but bouncing around right smack-dab in the middle of a graphics 8 block of screen!!?!?!" Then I spent the time to read the scroller.

Unfortuantely.. no code included. :)

Speaking of "lotsa players"... I'd like to clear up a fuzz in my mind. In the old Atari games JOUST and MARIO BROS., as well as in the new MARIO BROS., the enemies are really just playfield (background) (and in 1988 Mario Bros., VERY well animated, might I add!). Also the players (as in mario/luigi, and the "good-guy" jousters) are playfield too, but with players adding distinction between the rest of the things on the screen, and each other.

I'm right, aren't I? If not, then I'm REALLY confused on how they made those games!!!!

Maybe it's again the NTSC vs. PAL problem. On my PAL 130XE this camel demo isn't screwed up by any means. I guess there's too much DLI/VBI time used in this demo that it would work on an NTSC Atari.

Any comments from other PAL 8bit computer owners?

>last year, was it?)

I was amazed too. Compute! still officially covers the PC, Mac, Amiga,
and C-64, with most of the tecchie stuff being about the Commodore
machines. I picked up the January issue and the C-64 "Machine Language"
column by Jim Butterfield is _still_ kicking. There was at least one
other program listing, maybe more. It looks like this stuff appears
monthly.

C-64s are still supported and in production. Supposedly, Commodore
sold over half a million of the things last year, but your guess is
as good as mine as to who bought 'em. How the C-64 ever ended up
being more popular than the Atari 8-bit machines is a mystery
of the universe. That they've lived this long is simply incredible.

(All is not rosy in the Commodore world, though. The last glossy
newsstand periodical entirely devoted to the C-64, _Run_, has finally
gone under.)

303. Comp-Sys-Atari-Advocacy

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-03 16:49:29 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9302031600.AA23581@smithkline.com>
Source record: 108167

I'm not 100% certain what Dave Oakley means by "advocacy" discussions, I assume it's something on the order of "27 Reasons You Should Own An Atari".

This sort of discussion seems so typical of the ST community. I suspect it is symptomatic of an inferiority complex borne by ST'ers who must justify their existence in a world dominated by 486's & Macs.

Advocacy as an issue is almost irrelevant to the 8bit community. The weak-kneed among the 8bitters have long since fled the scene, & those few of us who remain have long since made our peace with the outside world & accepted the fact that we are struggling against the tide. All of us 8bitters are well aware of the existence of other machines (the issue has been addressed in various ways in the first 2 issues of AC) but for our own reasons have elected to stay with this platform regardless of its limitations or obsolescence. I daresay no 8bitter in his right mind would even bother to attempt advocating a 400/800/XL/XE vs. a Mac, IBM, ST, or Amiga. I think we all implicitly pretty much acknowledge the clear technical superiority of 16- & 32-bit architecture, so we all just confine our discussions to issues arising within the context of our platform & our particular market. The very fact that one almost never sees postings comparing an 8bit to other computers supports my contention that this is a non-issue for us.

I'm also wondering if "advocacy" isn't just a euphemism for "flame wars". Anyone who ever participated in the ST newsgroup accepts flames as a way of life. I was in the ST group for exactly one week. The gutter language & mindless arguments of ST-vs-Amiga were repulsive to me; I immediately knew this crowd was NOT for me & got my butt outta there fast. The slower pace & generally well-mannered behavior of the 8bit newsgroup were far more to my liking, & I've stayed on for several years now. I would hate to see any part of the 8bit community drawn into "advocacy" discussions. Since Atari has abandoned us, we have our hands full just maintaining our own existence. Our numbers & resources are meager. For any of us to get drawn into these silly "my computer is better than yours" discussions would merely deplete our resources further & contribute nothing to our community.

So... what is my opinion of establishing a comp-sys-atari-advocacy newsgroup?

In the words of Rhett Butler:

Ben, Just to set the record straight - most of the flaming that you see going on in c.s.a.s. was not started by Atarians - but usually by some of the non-atari users who can't stand the thought of their being another good atari machine out on the market. I think the setting up of the advocacy newsgroup is to drain that behavior away from the technical and discussion groups so that we, like you 8 bitters can get on with what is important to us - our Atari computers and knowledge of same.

I was as surprised as you to see the call for discussion include the mention of the 8 bit newsgroup also. I didn't know there was any "advocacy" going on there at all.

WOW! I didn't realize that AR was for the Mac!!!

And I hate to inform you, but from seeing AR, it seems QUITE unlikely
that you'd ever get the source to run on the Mac any way near how it runs
on the Atari or even how the Mac-specific version would run.

I mean, if you see an Atari version, and you know diddly-squat about
programming, you'd know what I'm saying. The graphics, etc.etc.etc. are
VERY system-specific. ho-hum.. as goes most programs. At least
Philip Price took advantage of it like he did! It looks great! (at least
the city. THat's the only one I've seen)

Yep! I meant you. As long as I'm posting, I might as well mention that the runtime package is available, at least on CI$. It also allows you to edit the runtime pack so you can write really tight code. For example, the file I was using to test my encoding scheme was a multiple window color scrolling demo, but even though it was written in Action!, it only took less then 400 bytes.

313. Atari 400/800 Joysticks?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-04 19:04:16 UTC
From: mattock@rand.org
Message-ID: <16115@nntp.rand.org>
Source record: 108175

Is there a joystick that has buttons for start, select, reset, etc. that works with the Atari 400/800? I'm getting tired of having to reach over to the keyboard every time I want to set off a smart bomb or go into hyperspace in Defender!

>So... what is my opinion of establishing a comp-sys-atari-advocacy newsgroup?
>
>In the words of Rhett Butler:
>
>"Frankly my dear, I don't give a damn."

Dave Oakley originally proposed a group name of comp.sys.atari.st.advocacy.
I (and others, I'm sure) suggested he drop "st" from the title because
of the Falcon and whatever future machines Atari Corp. may introduce. I
realized that the broader name encompassed the 8-bits as well, but I didn't
think this would make any difference for the same reasons you noted.

As for whether the group should be established, I don't care in the least.
On the positive side, it will get all the screaming kids out of c.s.a.st,
but pn the other hand it will legitimize the Atari vs. The World flame wars.
Personally, I wish there was a way to restrict access to these groups,
though I know it isn't possible. If only people who have serious interest
in Atari computers could participate in an Atari forum then most of the
problems would go away. After all, you don't see PC or Amiga devotees
going to Atari user groups and shouting "Atari sucks!" That would require
too much commitment for such a trivial act of stupidity.

I've found the best way to avoid undue stress and increase the enjoyment
you get from your computer is to flat out admit that it is not the most
powerful machine available or anywhere even close and just leave it at that.
A tremendous weight will be lifted from your shoulders when you stop trying
to compete with millions of computer collectors with big wallets who just
have to own whatever is hawked as cutting edge this month. Let them
go about their business.

> Philip Price took advantage of it like he did! It looks great! (at least
> the city. THat's the only one I've seen)

Lessee... came out for:
Alternate Reality The City:
Mac,AppleII,Atari, Atari ST, Amiga,C-64,T

The other one came out for only about 3 platforms.

My problem is that there SHOULD be the source somewhere for each of these
versions, since the Atari one is supposed to be "available".

With the source-code and a bit of tweaking, my mac version should run
on my new(er) machine.
As it is, my machine now gets wierd and dies, but then again, I no longer have
a Mac 512, either(came out for mac 512-talk about OLD).

Q to author of AR:
could it be possible, since nobody sells the program anymore, to release it as
pd/shareware? I don't know if this is so, but I know of a couple programmers
who were able to due to the company dying(and it reverting to them), or
their asking/it being okay since it is SUCH an old progrgram.

>submitted a BART request, would it also be held in the mail queue until
>11pm EST U.S.A., also ? Does this limitation apply only to the current
>academic session, or is it permanent ? I'm curious....

From the FAQ List (albeit a new edition to the FAQ List):

atari.archive.umich.edu is mirrored at the following 2 sites:
wuarchive.wustl.edu in the mirrors/archive.umich.edu/atari directory, and
src.doc.ic.ac.uk in the packages/atari/umich directory.
For downloading by FTP, the above mirror sites are functionally equivalent
toatari.archive.umich.edu.

BART works all the time.

The change is probably permanent.

Before you'll go to the Hobbytronic '93, I must say:
This year the A.B.B.U.C. (the initiator of the Hobbytronic-Demo) will not be present at the Hobbytronic, and therefore there's no Hobbytronic Demo. Perhaps a Atari Messe Demo is created for the Atari-Messe in August (if it will happen).

Until know, there no plans for it. Sorry guys ...

If there is an interest, I'll try to upload some older Hobbytronic-Demos to the archive (I've never uploaded stuff before).

This is true for COMPUTE! and Antic, but not Analog. Analog gave
authors the option of either selling or keeping their rights (not
surprisingly, the former option paid more). Being the money happy
dolt that I was, I gave up the rights to anything I ever wrote,
but that doesn't mean everyone did. A few years ago David Plotkin
and Jan Iverson were selling a collection of their Analog contributions
via mail order, before Analog went under. I assume they retained the
rights to the programs they were selling.

Dag,

CC65 does support pointers and structs. The only other one I am aware of is CC8, which is a compiler that you use with the Ace C library and linker and stuff.

>released to the public domain (same with Antic and Analog), so you are
>perfectly free to distribute any software found in those magazines.

I don't know if this is strictly true for ANALOG. When I sold stuff to
them, they bought North American first publication rights, not the copyright,
so technically they can't place it into the public domain without my
permission. (Antic and Compute both bought copyrights.)
I, personally, don't care one way or the other. It's about as
moot a point as you can get. But there are people who might, and if you're
concerned about staying inside the letter of the law, you should get
author permission before releasing anything...

And as long as we're talking about ANALOG -- I've got an Action! game I wrote
for them years and years ago that they never got around to printing. You
folks want me to dig it out and post it here? Pretty cool game. A quasi-
sequel to Yar's Revenge. (Heh. Speaking of copyright infringement.)

For those of us running AFS (Andrew File System) we can just access it by
cd /afs/umich.edu/group/itd/archive/atari/8bit
and then copying or viewing files as I usually would.

Perhaps something should be added to the FAQ about this.

It's not the joystick that is the restriction, it's the atari. I think
that you would have to modify your Atari to bring the switches out
through the cable. Good idea, though!

> gone under.)

Hey, does that mean that the Atari 8bit actually is outlasting the C64
in at least one area (assuming you call AC a glossy newsstand periodical -
a stretch right now)?

I don't know how many parts of the U.S. (or the world) have the equivalent
of the 'Trading Times', a very large newspaper print paper with pages of
for sale ads by individuals. In the computer section, that are an ungodly
number of ads for used C64 computers. I don't know if they ever sell
them. I'm not going to bother calling to find out.

One other note about Commodore. They just posted a huge loss for the last
quarter. Something in excess of $40 million (US) if memory is anywhere
close. Should be able to remember since I just read it a day or two ago,
but it wasn't important enough to commit to memory and I don't remember
where I read it. Probably the business section of the paper.

>description?

AFS is an internet-wide file system. The entire network could (concieveably) become akin to one, huge (& slow) distributed harddrive. It solves many of security/administration problems inherent in NFS. (NFS has been described as "an adequate replacement for FTP"). The root of the file system lies at Carnige-Mellon (CMU) and has child dirs at different sites all over the world. So a user on a system using afs can read files over the world in the same way (s)he reads files on the local disk. For example, my account has the home directory of /afs/iastate.edu/015/spam. Any user at any internet site that uses the AFS can access my files jas easily as their own (provided I give them access to my files. AFS provides good controls for limiting/granting access).

From: spam@iastate.edu
Message-ID: <C2224A.Ixu@news.iastate.edu>
Source record: 108199

Hi... My atari 800xk is connected to a P:R: connection. I loaded the sparta dos R: handler (called "rs232"), then ran the fillowing trivial program:

```
10 OPEN #1,12,0,"R:"
20 GET #1,A
30 PRINT CHR$(A);
40 GOTO 20
```

and all it does is spew out a stream of ASCII 81's (the Q character).

I know my PRconnection is working because 850 express works fine. So, does anyone know what I'm doing wrong?

Re: that camel demo...and lotsa stuff going on..

hell ya! even my IBM-owning friend thought it was awesome. and he doesn't know the half of it! all that "color" animation (like down at the bottom.. the snaking colors behind the scroll-line) is actualy mutliple-DLI's going on!

I actually was replying to a comment he made about it on his BBS. but when I went to type "+++" as an ASCII illustration, "ato" hung up on his BBS..

damn!!

and it was a long post, too! (of 3 long posts! oh well..2 for 3 :))

anyone got questions on scrolling? maybe I could capture those posts on his (IBM, even!) board and mail 'em to ya! :) hehe...

anything to impress the short-sighted IBM 13-year olds of my area.

Perhaps we should create the "-advocacy" newsgroup, and then when other people (non Atari users) start posting useless flames, simply reply as best we can, with honest facts...

like if someone came and said

"atari 8-bit suck!"

one might reply

"atari 8-bits can view 4096 color images..."

but not something like:

"atari 8-bits can view 4096 color imgaes.. c=64s cant! haha"

(no matter how much we'd like to, either...hehe)

Re: joystick that can do console buttons (Start/select/option)

no, I'm almost positive there isnt... but Atari's CAN use Sega/Sega Genesis controllers.. if that's any consolation.

ANy software out that supports multi-fire button/"start" capability of these controllers?

When I ever get finished with all my current projects and start work on a game, it'll support 'em!

>How did I manage to miss this game when I was growing up? What was it, what
>did it run on, what was it like to play, etc.

It ran on the Atari 8-bit computers, and was (I believe) the first game
included with the Atari 400/800. It was a realtime 3-D space combat game,
with a Star Trek style starfield zooming past you, and enemy spacecraft
flying all around you. You had to romp through the galaxy killing off
all the bad guys, while simultaneously making sure that they didn't
destroy your starbases.

The graphics were phenomenal for the time period (1979). They still are
impressive today. The game was just darn PLAYABLE; nothing can compare to
the moment when you're about to blast away the last enemy, and he scores
a direct hit on you, smashing your shields. The tint of deep space, formerly
a soothing blue, turns pitch black without your protective shield, and the
control panel flashes bright yellow in warning. Another hit, and you'll
be just so much scrap metal, if even that. Veering to avoid the enemy photon
racing towards you, you fire and miss! The enemy Zylon swoops behind you.
The computer tracking automatically switches to aft view as you momentarily
reorient yourself. Firing one last desperate shot, you hear a distant
rumble as a cascade of sparks blossoms on the screen and your enemy vanishes
in a violent explosion. The debris is slowly swept into the distance until
it fades into the infinite blackness.

Man, what a gem of a game. I think I'm going to play it when I get home
tonight.

349. Action! crash...the TYPE command

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-08 04:29:01 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <3aymyB3w165w@cyberden.sf.ca.us>
Source record: 108061

Well.. I've been working on what SHOULD be a simple command in my DOS CLI... the TYPE command. It opens up a file, and reads and displays it (via my display routines, which are simply routines that Print and PrintE, but also have the ability to pause every screen or so... that bit's still a little flakey I think. Needs more work.))

Unfortunately, it loves to TOTALLY crash... not just does it crash... but it crashes where RESET doesn't get out... and it crashes to the point that I have to hold RESET, and pull out the Action! cart (thus usually screwing up my RAMDisk a little) to get the computer to stop sitting there (probably grinning at me.)

Anyways... Is this a revision bug... this crash syndrome.

Also, I've found that Action! kills my program sometimes. My commands die, (ie, I type "DIR" and it says "can't open directory", so, even after making a small program in window 2 of Action! that sets the directory to "D1:", I eventualy have to resave the source and "BOOT" from Action!'s monitor)

And fianlly.. I got a nice device NAK (MyDOS error 139) when doing ANYTHING to one of the files on my RAMDisk. I eventually was able to rename it "_._" and resave what it was (source) and have that bit of wasted space "Out of my way"...

Anwyays.. what's with Action! acting weird after a couple of Compiles and Runs???

Is it just my source!? :)

BTW: since restarting MyNI_DOS over (rather than have my release end up being called "MyNI_DOS 3.0", since this is a >from scratch< restart), it's ended up being quite smaller, and still doing about as much as it did before, but much more nicely..

see next post for some nifty variable handling I've programmed! :)

350. ScotchDOS (aka MyNI_DOS 3.0) variables!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-08 04:35:00 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <2kymyB4w165w@cyberden.sf.ca.us>
Source record: 108062

Alright folks. You've probably all been waiting for the release of MyNI_DOS 2.0. Don't hold your breathe. MyNI_DOS 3.0 (now officially called ScotchDOS) (for now, at least. :) any ideas on a better name? :) hehe) is being worked on.

So, far I've got planned over 50 internal commands (from things like directory changing and making, to key repeat speed setting, to file typing, to batch file running, to memory dumping), but by far the most notable difference between ScotchDOS and any other DOS out there (that >I< know of) is that it handles variables.

36 to be exact. 36 card variables (2 bytes.. decimal values ranging from 0 to 65535 each) named "0-9" and "A-Z".

Variables are denoted with the "#" character. So if you said:

#A=1

then the 10th variable, variable "A", will be assigned the value of one.

If you said:

#A=+1

then you would be incrementing the value of "A" by 1.

The other operands include "-" (subtract), "*" (multiply), and "/" (divide...no decimals used)

I'll add MOD and DIV and all the other goodies that Action! handles if anyone is the least bit interested (updating that bit of source is easy-peasy).

ScotchDOS also handles environmental commands:

CLS clear screen
PAUSE screen pausing (ooh!)
NOISE i/o noise
CLICK key noise (feedback, click, what-have-you)
SPEED key repeat speed
REPORT status reporting (ie, errors, things like "Directory made", etc.)
% display text (with end-of-lines allowed (via "\E"), as well as displaying of variables (decimal for now.. hex and character is planned) (via "\#"), and the ability to wait for keypress! (via "\K"))
An example would be:
% Hello, user number \#A.\EPlease press a key.\K\EThank you.\E
that would do this:

Hello, user number 0.
Please press a key. <waits for keypress>
Thank you.

I may allow for variable declaration out of the keypresses.
(there will definately be a command for it, tho... good for menu
programs...
programs?! yes..with batch file processing, IF/THEN and even
GOTO-style commands will be avaliable...all using Note/point
and line skipping.)
(I've made languages before... I know what I'm doing!)
(at least >I< think I do! :))
ECHO batch file echoing
PROMPT full/partial prompting (a "D1:HELLO:GAMES:" verses just a "D1:")

Here's an example of how most of the above commands work.. using the
PAUSE command as the first one:

typing:

PAUSE

returns (as default)

PAUSE ON

this tells you that the screen pausing is on..

typing

PAUSE OFF

returns (as a response to your action)

PAUSE OFF

this tells you that the screen pausing is now off. so if you type "PAUSE
" again, it will reply with "PAUSE OFF" now...since you just turned it
off!...

Numbers are allowed, as well..

typing

PAUSE 1

returns

PAUSE ON

because any non-0 number returns an "ON" value (because PAUSE is just an
On/Off situation)

you can also use variables...

say you said:

#P=1

it replies

Variable assigned

telling you that your command was Ok. Now the variable "P" has a numeric value of 1.

typing:

PAUSE #P

returns:

PAUSE ON

because Pause is on, since variable "P", being 1, has turned it on. (1=on, remember?)...(actually... <>0 = on, to be exact)

Finally... you can have variables be assigned values of these commands

say you said

PAUSE ON

it'll reply

PAUSE ON

... pausing is now on...

then you type:

PAUSE |#A

it says

Variable assigned

varivariable #a is now 1!!

351. Re: ScotchDOS (aka MyNI_DOS 3.0) variables!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-08 05:06:09 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <y1ZmyB6w165w@cyberden.sf.ca.us>
Source record: 108063

Part 2:

Well, in my last post, I described all of the ways I got ScotchDOS to handle "flag" commands (things that are toggled... either ON or OFF.. like ECHOing, PAUSE-ing, PROMPTing, etc.)

Now for something even better... variable "switches" (hmm... let's call them..."dials" :))

The SPEED "dial" is an example. SPEED lets you control the key repeat speed of your keyboard. 6 being the normal, Atari OS default, 0 being no repeating (you must release and re-press the key to repeat i), and 1 being the FASTEST... and 255 being downright SLOW..)

Put simply, speed affects the value of location 730 (or was it 731)? on an XL/XE computer..

Here're some things we could do with it:

```
SPEED |#A
#A=+1
SPEED #A
```

the above would increase the value of the SPEED register by one.

Theoretically (it's planned.. just not tested as of yet), you could do that in one fell-swoop (is that how you say/spell it?)

```
SPEED +1
```

Now, if my program correctly sends the current value of the speed register into the Function "FindVal()", the value sent back should be 1 more than the one sent in.

FindVal() works in correlation with GetVar() (when it sees a "#" symbol) and even has that little routine to react to "|"s by assigning variables)

Well.. that's enough about the numeric variables of ScotchDOS.

Now for STRINGS! :)

They've not been added yet, but eventually, you'll be able to do the following (the command names used are just being made up as I go, however):

```
BAT FONT ITTY.FNT
```

that would run the batch file "FONT", and send it the parameter
"ITTY.FNT".

(you could just as easily make a COM file to do it, as well.. the
parameter handling would most likely be handled by an INCLUDEd routine
included in the ScotchDOS files...

!FONT ITTY.FNT

where FONT is a ".COM" file on the drive..)

The file FONT.BAT would looks something like this (when TYPEd or EDITed,
or loaded into an editor or w/p or printed to paper,
etc.etc.etc.etc.etc!):

GETPF 1 (gets a paremeter, as a filename, and stores it
in filename (string) number 1... I'll make at
LEAST two or three filenames (strings) avail-
able... again, there are 36 card values avail-
able already)
RAMTOP |#A (gets RAMtop (location 106..a PEEK would be just
as effectve) and stores it in variable A)
#A=-16 (take off... oh.. 16 pages ...we only really need
4, because a font is 1K (4 pages), but I'm so
used to 16 pages... oh well)
#A=*256 (now convert the page number in an address, for
the next command to use)
OPEN 1,!1,4,0 opens file thru IOCB #1 for read ... the file
name here is "!1", meaning string #1...in this
case (with the ITTY.FNT being sent), it's the
same as "OPEN 1,ITTY.FNT,4,0")
BGET 1,#A,1024 (load the font)

gotta run
(again)

Hi!

I think the latter two letters on the subject pretty fairly show my point of view. Once this newsgroup is set up I'll be soon unsubscribing it.. I'm doing it all because the flamewars are ruining our atari.st newsgroup!

I fully appreciate that 8-bitters (that's the correct term, isn't it?) won't be taking much of an active role in the new newsgroup, but since Atari have a policy of giving their new computers new names, then the name seems to fit best. At some time someone will probably create a atari.falcon newsgroup for the latest in the line (please keep your fingers crossed for it!) and again the advocacy group will need to encompas this.

Oh, lastly, I know it doesn't really affect you much, but those who are in favour to the group, in principal even if you wouldn't use it, please vote for it when the CFV comes through. Vote against it, even, but we need 100 votes in total to get it counted, and I have this nagging doubt that we'll have enough people!

Thanks for your time....

David.

>Hey, does that mean that the Atari 8bit actually is outlasting the C64
>in at least one area (assuming you call AC a glossy newsstand periodical -
>a stretch right now)?

Someone emailed me that COMPUTE!'s Gazette, a Commodore only magazine,
is still being published. I don't know if this is true or not. The
only other C-64 'publication' I know of is "C Hacking" which is
sporadically posted to comp.sys.cbm. It's surprisingly good IMO.
My monitor is glossy, does that count?

For whatever it's worth, I much prefer to read old-timey, informal
publications like AC over almost all PC programming rags. I can't
quite put my finger on why (and it's not that I hate the PC).
Possibly there is an underlying arrogance and lack of tolerance.
(This is meant as kudos for AC, not a flame against PCs.)

After reading the advocacy groups for a while, you'll see that this
won't work. Those people just like to argue and will go on and on
about anything. Actually, it isn't just the advocacy groups
(watch rec.food.cooking for the dreaded 'Cool Whip vs. whipped cream'
or 'Miracle Whip vs. mayo" debates).

IMO you can't discuss the merits of one machine versus another on
a purely rational level--or maybe you just shouldn't. There is a
lot of personal preference involved. You could systematically 'prove'
a particular machine to be better than the 130XE, but what does it
matter if the Atari owner is enthusiastic about his computer and
uses it to increase his productivity and general enjoyment and the
other person is simply a collector and comparer? Or even if this
mythical other person really _does_ like and use his computer, what
does it matter?

Blame it on your source. The code Action! generates does not do anything special, it's really rather vanilla stuff: [no garbage collection, no stack usage, etc.] . I make/made a lot of mistakes with Actionn! that are hard to track down. My favorite is to switch from another language like Assembler, then do a:

```
CARD x=0
or
BYTE x=0
vs
CARD x=[0]
```

Pointers are also deadly when you're doing memory operations. A nickel for everytime I'd pointed to the middle of page 0 & I'd be a rich man. In the good programming is really good debuggin vein. Start doing dumps from the monitor of page zero before & after you run your code. Sometimes you can catch something like DOSVEC being modified. One of the best methods is just making the PROCEDURE's null one at a time to find the offending code. Something like original:

```
PROC BS()
;bunch of code;
RETURN
Becomes:
PROC BS()
RETURN
;bunch of code;
RETURN
```

As soon as the thing stops crashing, you've solved the riddle.

Are you talking about an MIO ramdisk? I don't think error 139 can happen on an internal ramdisk unless you have a bad copy of Mydos. If it's an MIO, could be a hardware problem, or maybe it's configured wrong (DOS configuration not matching the actual size of the ramdisk).

Bill Marcum bmarcum@world.std.com

364. MulitMouse Driver (M:)

Got a copy of the _AC_ disk today. With Multi-Mouse drive on it.

VERY nice. Only thing I dislike about it is the fact that it's not multitasking, but hey... it's still pretty damned awesome!

I'm sure we'll soon see some nice M: supporting software coming out soon, eh? :)

(hmm... with ScotchDOS, since you can do pretty much ANYTHING (call routines, access POINT/NOTE/XIO, etc.) from the command line, I could see programs handling the M:ouse that are even run from batch!

wow

Source record: 108074

I seem to have come across a moving string :). Unless it's in the part of the technical manual that I have that is corrupt (couldn't finish the unARC), it seems that the MyDOS manuals don't specify where the current directory is stored.

Great help to me, eh? Since I'm working on a replacement (let's call it an upgrade? :)) for the current DUP.SYS menu, that is...

Anyways... oh damn.. lost the paper. Well.. I did a search of all of the memory (via BASIC) for any string that is the same as what I set the current directory to (via XIO 41, aka "CD", aka "R"-set directory)

But... I found that it moves around in memory. So ... can anyone out there supply me with the pointer to this string? Or if it doesn't have a pointer, what it's offset is... and to what RAM position (ie, is it above RAMTop, below MEMLO ... have I got that backwards?)

Inotherwords.. could SOMEBODY help me!? (geez.. I hope I don't
get 100 responses saying
"yeah! sure! it's ....,
didn't you KNOW that!?!"
...would I feel dumb..)

hehe

367. AC Reaches New Zealand (At Last!!)\

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-09 10:56:51 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9302092139.AA00716@smithkline.com>
Source record: 108077

Hello Dawn,
I hope you get this, I'm CC'ing it to the Newsgroup also.

I received the first New Zealand subscription in the mail yesterday. From the scribled note on the back of the subscription order it appears the Premier Issue appeared Down Under about the end of January or so.

Although I'm glad all you folks Down Under have finally received the magazine, I must say I'm rather depressed at how long it took. Apalling, really. a pattern has emerged that I find disturbing. From various reports around the world, the following picture emerges as to the timing of the mass mailout of the Premier Issue of AC:
October 30: 800 magazines arrive at the mailer
November 3-4: the mailer posts the magazines
November 15-December 15- the magazines are delivered in the USA
December 1-December 30- the magazines are delivered in Canada
November 5-December 5- all overseas deliveries are sitting in Chicago for one solid month!! Sidetracked by the Xmas rush?
December 10-January 3: the magazines are delivered in the UK
& also in mainland Europe (France/Italy/Belgium/
Germany etc.)
January 4-11: AC reaches Israel
January 11-20: some copies still being delivered in Germany
January 15: AC reaches Korea
January 25-February 12: AC reaches Australia & New Zealand

The one-month holdup in Chicago is causing us some awful logistical problems RE: late subscription orders from Europe & the Pacific where the delays were most severe.

Fortunately nearly all our overseas subscribers are wise to the hideous performance of surface mail & are electing airmail delivery. Late-arriving subscriptions from the delayed mailings will be serviced as though they had been sent in on time back in December. AC will not penalize those folks for being late; their subscriptions will start with the Premier Issue as stated on the order form & they will be sent the Feb. 1993 issue as soon as their order is received & processed. I estimate that Australians & New Zealanders will have the February issue in their hands 3 weeks from the date they mail off their subscription order- provided the order is sent airmail & they elect airmail delivery of the magazine (1 week to get to me, 1 week for processing, 1 week for delivery). Late arrivals who also want the Software Disk will find the disk included in with the magazine. In future mailings the disk & magazine will be mailed separately.

Subscriptions are still dribbling in at the rate of about 10/week. The total paid subscriber base is somewhere around 350-400, with disk subscriptions

numbering around 225.

Since we are about 20% shy of the original goal of 500- upon which all our business cost projections were based- we'll be stuck at 32 pages & crummy 3rd Class Bulk delivery (North America only), & will likely drop an issue over the summer. I'm monitoring subsscriptions on a weekly basis, so things could improve linearly as a function of the growth of the subscriber base.

In any event we have enough people on board to publish at least 5 issues in 1993 plus 3 Software Disks. That's the worst-case scenario. If we reach the magic 500 figure, then we'll start looking at restoring that 6 th issue, going to 2nd Class mail in the USA, & possibly going to 40 pages. If the dribble of subscription orders continues at the present rate we might get there by May. At this point in time we are only limited by the sluggish participation of the 8-bit community.

The February issue was mailed out last week & the April issue is now in production.

BTW, I'm still working full-time at my regular job as a research chemist, AC doesn't pay anything. The only sacrifices to my personal life demanded by AC are that I gave up sleeping & having a social life. Other than that, it's not too bad!!

Best wishes to all you Down Under 8-bitters from AC!

All directory names at the Archive have uppercase capital letters.
Therefore you should try 8bit/Demos/xxxxx instead of 8bit/demos/xxxx.

> -Dag- *** Dag.Hugdahl@tdkt.kksys.com

The CC65 compiler supports structs and pointers!
Only typedef, unions and realmath aren't supported.
Especially the absense of typedef restricts the use of
structs, because normaly, you define a structure as a new
type, and then use ist.
But something like

```
struct $(
int c;
char buffer[40];
char * pointerfield[100];
$) myvariable;
```

should be possible.

370. Mega-Font-Texter 2.06

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-09 14:03:10 UTC
From: chrisker@cs.tu-berlin.de
Message-ID: <1l8diu$bqv@news.cs.tu-berlin.de>
Source record: 108082

Hi,

i am the creater of the program MEGA-FONT-TEXTER wich was distibuted
by werner-raetz.
in last summer i offer him a new very good version of this program:
Mega-Font-Texter 2.06

it has the folowing features:

WYSIWYG on a 640*192 scrolling Screen !!!!
a column-lineal in inch
module-feature (for later developments (bar-graph-display etc.))
and it works with new mega-fonts (more disk-space in directory)

it runs (really run - because i take only assembler and quick as language
NO MORE turbo-basics)
on a normal Atari 800XL but it also supports a ram- or eprom disk in
your system (configurable...)

it includes also a very good printing-module,
(the best prints on a 9-Needle-Printer with a 8-Bit Atari i ever
had) because it transforms the screen-resolution into the
hires 240*212 DPI printer resolution.
7 printing-modes are supported

when changing from the TEXTER to the PRINTER-Module (and back) your
workspace is saved (also normal XL) in RAM !!!
German - special-characters (ue,sz .. are supported).

this program is realy fantastic (and take a lot of time development)
but it not seems that mr. raetz want to distribute it....

so i will try to distribute it on my own...

if you want to have more informations from this program, mail to
chrisker@cs.tu-berlin.de

thanx !

371. Re: Star Raiders...what was it?

Newsgroup: comp.sys.atari.8bit

The neat thing about Star Raiders, something that still makes it impressive and playable today, is that nothing is canned or faked. All the different game elements act independently and together they create tremendous variation and subtlety. The detail was simply amazing: varying degrees of damage on at least half a dozen subsystems, you could still shoot and be attacked when you were looking at a full-screen chart, you could shoot your own starbases, you could be shot by enemies behind you, explosions weren't precomputed sequences--each particle moved properly in relation to your ship, you should shoot things while decelerating from hyperspace, etc., etc.

I remember reading a strategy guide to Star Raiders, and MAN was it detailed. There were all sorts of things that I never even _thought_ of trying.

At our school there was a big deal about copyrights with professors handing
out scientific papers and diagrams taken from books.

The solution was that students now are told what to copy (paper etc.) and
then do it themselves since a copy for personal use or study is not in
violation of the law.

I think any kind of mass copying/distributing of the mag. or articles would
be illegal though...

I don't think this is the problem. The problem is that the port needs to be
put into a concurrent mode first, before one can read from R:. This is done
by issuing an XIO 40,#1,0,0,"R:" from BASIC

There were also versions of Star Raiders for the Atari 2600 and the Atari ST computer. The 2600 version came with a touch pad controller. The controller had buttons for shields on/off computer on/off, warp, Galatic map, etc. This was the only game that used this controller. There was a bigger version of this controller for the Sesame Street games call Kid Pad (?) though. The ST version was as a reviewer said, like Star Trek: The Motion Picture, great graphics but no story. It was just too easy compared to the 400/800 version. The playablity sucked badly. For example to fire AFT torpedos, you had to manuver with the joystick and press the space bar to fire while being attacked from fron't and back at same time. I believe there was a 5200 version of Star Raiders too. Looked and played just like the 400/800 version. I don't know how they managed the keyboard though. Anyone know?

^^^^^^^^

I have a set of Floating-point math routines, similar to those in the ACE-C
runtime (ENGINE.OBJ) for CC65 that I'll be releasing shortly. Not conveinent
but useful for when floats are required.

This is for the various replies to my missive on the proposed newsgroup. Yeesh, I was merely expressing my opinion of the matter. Possibly I got carried away, as the issue raised up some unpleasant associations I've had with other groups in the past.

I wasn't aware Dave Oakley posted the message here out of courtesy. I took it at face value. He invited opinions, I gave mine.

Whether the flame wars in the St newsgroup are posted there by outsiders or by ST'ers is almost irrelevant to me. The bottom line is that the flames appeared to me to be TOLERATED by the newsgroup in general. I recall seeing nothing in the way of condemnation for the vulgar language I saw. I got no use for such goings-on. Especially here at work, I'm dumping the digest to a printer down the hall & my boss shows up to retrieve his email just as a pageful of the "F word" is coming out the printer from the ST digest. The commentary from my supervisor left- shall we say- a lasting impression upon me.

Any newsgroup founded for the express purpose of advocating one platform vs. another stikes me as just plain wasteful. I mean, what, people got nothing better to do with their time?

And I maintain that for this is a non-issue for us 8-bitters. I'm just one person expressing my personal opinion, others may disagree, let them say so on their own merits without reference to what I say.

And of course I'm grateful to Dave for extending the courtesy.

So now, let's try dealing with some SUBSTANTIVE issues. Anyone care to venture opinions on why 615 people last year signed their names pledging support for an all 8-bit magazine, then when the time comes fewer than 200 honor their pledge?

I'm of the opinion AtariUser should be struck from the FAQ list. Unless those guys have found a new 8-bit columnists I don't know about, they aren't really an 8-bit support mag any more. Chuck Steinman disappeared from the pages of AU sometime around the spring of 1992, & the last issue I saw (Oct. '92) had no 8-bit coverage at all.

In Sept. '92 AU pressured me to write for AU in Chuck's place. I declined, being at that time somewhat preoccupied (!) with preparing the Premier Issue of AC in time for the WAACE Fest.

I'd be real surprised if they've resumed 8-bit coverage since October.

I wonder how I overlooked that. I was just reading the doc's and it says
in plain print "Structs, unions, arrays, and pointers are all supported in the
usual fashion." Oops!! I don't know what I was thinking about!

BTW: The docs I have say they are preliminary docs. Is there any other,
more extensive documentation available?

383. TrakBall

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-10 05:54:23 UTC
From: bbs@neb
Message-ID: <1993Feb10.055423.7017@neb>
Source record: 108093

Just got my Cx-80 TrakBall from BEST today and was curious about just what programs/games exist exclusively for use with this device?

Thus far, I have found that Missile Command works great in TB mode (this is a switchable TrakBall [from Joystick to TrakBall mode] after hitting Control T, but Centipede will not allow upward movement without tiresome upward rolling of the ball.

Also, if anyone has any interest: I ordered what I thought were two 130xe dust covers from BEST, but what I got instead were two 2600 VCS dust covers. Upon calling BEST, Brad (the owner) indicated that this was what he was selling as a dust cover for the 130xe since the sizes were 'ALMOST' the same. After much playing with these dust covers, I've come to the conclusion that they are worthless for my 130xe machines, so I've put one on my old 2600 and would like to sell the other. If anyone wants it, send $3.00 plus postage to me at:

James King

I seek a Star Nx-1000 rainbow 9pin printer..

Will pay cash or make Atari8 trades...

Contact me Monday thru Friday at 800-678-3440 between the hours of 0700
and 1600 (7:00am and 4:00pm) Mountain Standard Time. Ask for Jim..

Printer doesnt necessarily have to be the Rainbow or even the Nx-1000,
but must be somewhat compatible or similar to those printers..

Yes keep using theatari.archive address, this is to help you find the archive
if it is moved to another machine.

>opinions on why 615 people last year signed their names pledging support for an
>all 8-bit magazine, then when the time comes fewer than 200 honor their pledge?

For the record, I honored my pledge. I planned on subscribing even if
I hated the magazine, but fortunately I like it.

Now for the speculation as to why not everyone chose to subscribe:

* The pressure to switch to an ultra-cheap PC clone is very strong,
stronger than it ever has been: prices are at an all time low, there
are finally some tolerable operating systems available, the PC games
market has really heated up, etc.

* It was easy to get swept up in the "yeah! we're gonna take over
the world!" talk of the mail campaign. After all, making commitments
via the net or a postcard is a lot less of a hassle than writing
a check.

* Unfortunately, there hasn't been much significant activity in
the Atari world. Some stale new games, some new utilities, etc.
Look at the ads in the premiere issue of AC--pretty blah IMO (this
is not AC's fault, of course). What's sorely needed is a company
that produces 8-bit products which get people excited again.

* Many of the 615 people were college students, still using their
parents' Atari 8-bit computers. These people will most likely buy
a Mac or PC when they _have_money_. Lack of which being the reason
they can't subscribe to AC.

In addition to an 800, I also own a PC clone. I don't see the
clear cut "PC is powerful, Atari is a piece of junk" line that is
so clear to many; I know enough about computers to realize that
there are very few such lines. I don't see what's wrong with
using and programming a 486-based machines and also working with
a 130XE? Heck, the two activities aren't mutually exclusive.

Source record: 108103

Forget C and Action, QUICK is here! (Or at least it will be when I finish the manual!).

I have the system disk for QUICK from PPP, and I am currently in stage 3 of editing the manual (i.e. checking the first typeset draft).

Quick arrived on the doormat this morning (we don't have mailboxes in the UK, mail gets shoved through a hole in the door called a letterbox if you folks in the US didn't know!) and within 2 minutes I had my very own nice scrolling text flying accross the screen! Just had to change a scroll demo program on the system disk!

OK, you should know this, but QUICK has lots of features built-in which are unique on the Atari. Things like built-in mouse control, Blitter, Digitized sounds player built-in, built-in synchronization command for synchronizing statements to M/C, built-in support for interrupts with no hard work!

QUICK outputs straight to a .OBJ file which you can run from DOS.

I will be distributing it in the UK, and we think we may have a distributor in the US as well, so it will not be difficult to get hold of!

393. Game Fun w/ the Black Box!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-10 22:46:24 UTC
From: alj@bilver.uucp
Message-ID: <1993Feb10.224624.2685@bilver.uucp>
Source record: 108107

After purchasing a Black Box, I quickly realized it could help me
breathe new life into some old games that I gave up on because they were
too difficult or didn't quite work the way I wanted. How? By entering
the 6502 monitor and messing around a bit with memory, you can produce
some wonderful results with many programs, mostly greatly extending how
many lives you have. I've compiled a list of programs I've bothered to,
shall we say, "fix". They are listed below, along with some comments on
what you are actually doing. Have fun and if anyone else has done this
with other programs, feel free to post your modifications!
! Note ! Since there were many different versions and formats of the
programs I will describe, these cheats may not work with what you have.
In fact, it's possible they may be damaging to your system. Therefore,
please write-protect your hard drive, remove the disks and take whatever
precautions you can to ensure that if your computer goes blammo nothing
that a simple reset won't fix will occur. Be careful!
To use this information, make sure you have a Black Box. Next, load
the game. Select whatever options you want and then start the game.
Press the left black button on your Black Box to get your menu of
options. Choose <C>, the 6502 Monitor. When told to place a value at
a certain memory location, type an "*" followed by a space, the
memory location and then press RETURN. For example:
* D01D <Press RETURN>
Next, type a "D" then a space and the desired value finished with a
RETURN, like so:
D 3 <Press RETURN>
When you are finished poking around with memory, press the ESCAPE
key twice, once to get to the menu and another to return you to your
program.
As a special note, the Black Box tries to restore you to exactly how
you were upon entering it. However, it cannot retrieve your player-missile
graphics, as it has no way of knowing whether or not they were on when
you were in the program. Therefore, deposit the value of three (3) into
location $D01D just before pressing Escape twice to get back to your game.
This will restore the graphics, although they might just look like screen-
length lines when you are still in the monitor mode. This step may also
not be necessary for all games (those that don't use PM graphics).
****
Joust (Cartridge) - Place $7F in locations $A8 and $A9 to give 127 lives
----- to each player.
Gauntlet (Shareware Shoot-'Em-Up File) - Dump $EAEA (NOP instructions)

Another game that uses 'true' trackball mode is Synapse's Slime. It's
the only other program I've seen that will.

I wonder if it works as a mouse; will the buttons work independently...

Could test it with that new game Ping (on port 2).

I SURE there is a time limit on the copyright of software. From a previous
post that said Antic and Analog gave the rights to the software authors
themselfs. Wonder if that starts the time limit over again?

Any one care to comment or know for sure???? I have just about EVERY Analog
from issue #3 on! Would be GREAT if I could send copies (Being legal)

From: ez033399@othello.ucdavis.edu
Message-ID: <22439@ucdavis.ucdavis.edu>
Source record: 108109

Hi everyone,

I just pulled out my 800xl after several months of having it in the closet. To my horror, the modulator that connects the computer to the TV switchbox was stripped (it got caught under something). Anyway, I need a replacement, and have no idea where to get one. Could anyone sell me one, or kindly direct me to someplace I could get one cheap? I live in Northern California for purposes of nearby shops. I've heard of TOAD, but I don't currently have a catalog from them. I would like to get this modulator ASAP.

Please reply to the address ez033399@chip.ucdavis.edu, as I do not log onto the above account very often.

Much appreciated,

John Peters

In article <wookie.3uhk@terapin.com>, wookie@terapin.com (Barry Vanover) writes...
>I SURE there is a time limit on the copyright of software. From a previous
>post that said Antic and Analog gave the rights to the software authors
>themselfs. Wonder if that starts the time limit over again?
>Any one care to comment or know for sure???? I have just about EVERY Analog
>from issue #3 on! Would be GREAT if I could send copies (Being legal)
>Wookie

Sure. The copyright law covers intellectual property (books,
paintings, software, etc.) Current copyright extends to the
life of the individual holding the copyright plus 50 years.
So, well into the next century you could post all the Analog
and ANTIC articles you wanted.

Copyright protection, on the other hand, is the responsibility
of the copyright holder. If a copyright is infringed, it's up
to the holder to pursue the legalities.

Witness the song you sing at someone's birthday party. Officially
known as "The Happy Birthday Song". It _is_ copyrighted, two
sisters hold the copyright. You can sing away any time you want,
but don't try to do it in any revenue-generating manner (ie:
commercials, TV shows) cause you'll have to pay a royalty. They
copyrighted the song in the early part of this century, btw, so
the copyright is due to run out by the middle of the next century.
(They're still alive!)

Of course, one could contact Larry Flint Publications, the last
owner of Analog. Issue #12 of Analog states that published
submissions become property of the magazine. I'm sure this was
carried over when they sold it to LFP.

403. Sale: Action! , C, Assembler

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-11 19:23:23 UTC
From: simmons@cs.washington.edu
Message-ID: <1993Feb11.192323.8675@beaver.cs.washington.edu>
Source record: 108124

I seem to be spend my time writing C and lisp code for Unix boxes these days, so I want to lessen my grad-student poverty by selling off some of my beloved 8bit development tools. <sniff, sniff>

I'm willing to ship outside the U.S. if you'll pay for the shipping and any duty or value-added-tax. U.S. shipping will be $3-4.

Action! Cartridge & Goodies ($30 ?)
==========
* Action cartridge (version 3.6)
with 208-page manual in a spiffy yellow mini-binder
* Programmer's Aid Disk
full single-density disk (0 free) from OSS, with Action! source for demos, turtle graphics, player-missiles, extended disk I/O, etc.
* Runtime disk (from back when you had to _buy_ it :-))
* Top Level Tarry magazine #1 - 3
"beginning Action!" tutorial (16 8.5x11" pages), tips, bug notes, some code listings.

Deep Blue C compiler ($15 ?)
==========
* disk version (with manual) from Atari Program exchange
* produces executable code (no assembler needed)

C/65 C compiler ($15 ?)
==========
* disk version (with manual) from OSS
* produces MAC/65-compatible assembly code, so you'll need MAC/65 or a compatible assembler.

MAC/65 assembler & Bug/65 debugger ($15 ?)
==========
* disk version (with manual) from OSS
* spiffy assembler -- back when I was forced to write some assembly code for the C= 64, I used my Atari as a cross-assembler rather than use C= tools.

Documents: DeRe, Tech, OS/DOS source ($15 ?)
==========
(I'm typing the names at the U, from memory (such as it is :-)))
* De Re Atari ("All about Atari") -- programming overview
* Atari's hardware / OS technical manuals. With these and De RE you're ready to do low-level I/O programming, create custom display lists, etc.
* DOS (2.0?) and (400/800) OS source code listings

Prices are negotiable, especially if you want more than one item.

405. nasm v20 (finally) released

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-11 22:36:16 UTC
From: wallmann@backus.pu.informatik.th-darmstadt.de
Message-ID: <1993Feb11.223616.14333@news.th-darmstadt.de>
Source record: 108113

Well I hope everything went well, when I grabbed the source from the
Sun and the binaries from my Atari, but since I am under intense
time pressure and I needed to get this stuff out, finally I have
released it today.

Just a rundown of the features:

o Crossassembler for 6502
- produced linkable code
- code is runtime relocatable, no more Page 6 blues
- is MAC65 compatible
- does everything you want, and better than you expect

o Linker
- produces Bootsectors (if asked to)
o Librarian

o Mac65 detokenizer

o Disassembler

o Binaryconverter for C64 and AppleII (should work)

o and two or three more goodies.

Binaries provided for Atari ST and Amiga.
Sourced provided, compiles on Unix (HP and SUN tested)
Will probably compile under MSDOS with TC2.0.
Will definetely compile under MSDOS with gcc. I couldn't
provide those binaries, coz M.Reichl didn't send them to
me. Bugger him about it (har). Nah just kidding.
Will not compile with TC3.1++ (that compiler sux bigtime)

If someone manages to compile them for MSDOS, please put
them in the nasm20 folder on atari.archive.umich.edu in
the 8bit directory. They should be moved there pretty
soon. For German users I put the stuff in ftp.uni-paderborn.de
in incoming/nasm20. Due to a bug they are already fetchable
there (hint). Please put ported binaries there too. Also
please include in your port a statement, that you did this,
since I don't want the fame nor the flames.

If your still doing 6502 development, this is what you
were waiting for. (shameless braggin' eh ?)

Enjoy
Nat!

>I'm of the opinion AtariUser should be struck from the FAQ list. Unless those
>guys have found a new 8-bit columnists I don't know about, they aren't really
>an 8-bit support mag any more. Chuck Steinman disappeared from the pages of
>AU sometime around the spring of 1992, & the last issue I saw (Oct. '92) had
>no 8-bit coverage at all.
>
The Nov. '92 and Dec. '92 (Dec. is the latest issue that our Users'
Group received) also have no 8-bit coverage at all, unless you count 1
(one) letter in the Dec. issue on an 8-bit topic (I don't, since the
people responsible for the magazine didn't write the letter, just the
reply). It's a shame - AU still shows their little square 8-bit
"logo" along with the ST, TT, Lynx, etc. but no 8-bit
articles/columns are actually in the magazine.

BTW, does anyone know if Chuck Steinman is still working on any 8-bit
stuff? I had been looking forward to his TC8 'C' compiler, but I
don't think he ever finished it.

>the concurrent mode Whoops! R: above, for most stuff, just modeming.

As far as I remember the PR connection manual says that one can't read from
the R: device until it's put in the concurrent mode. If there are no
characters to be received, freezing up is _precisely_ what happens, that is
until some characters arrive at the input

* 6/#B value 6 divided by variable 11

o ON on
o 1 on
```

o +#1 increment switch by one (if 0, then on, if on, then on)
o |#A assign variable 10 to switch's current value

-- D:*.* current D:rive/directory as path, *.* as filemask
-- R: R:S232 handler
-- P2: P:rinter 2

_____________ORDER_____________
command name
description and options
____

CLS clear screen
Clears the screen.

CLR clear variables
Clears all numeric variables to 0.

[D]x[:] change drive
Changes to a new drive (also can be used to return to root of
current drive).

LAST last report
Displays last report (ignores whether report mode is on or off).

v=* set variable
Sets variable "v" to a value of "*".

CLOSE [*] close channel
Close an IOCB channel (no parameter closes all used (1-5)).

% [--] display text
Displays text onto the screen (no parameter does an end-of-line).
Commands available within text:
\\ display a "\" character
\E do an end-of-line
\#v display a variable
\K wait for keypress

WHERE current directory?
Displays current drive/directory (ignores whether prompt mode is
on or off).

CD [--] change current directory
Changes directory (on current drive).
No parameters or ".." moves back one directory.

> -- change current directory forward
Changes directory (on current drive).

< change current directory backward
Moves back one directory.

DIR [--] display directory listing
Displays listing of files.

No parameters displays directory of "D:*.*" (all files).
No drive path defaults to current drive/directory ("D:").
No filemask at all or after a ":" defaults to "*.*" (all files).

MK -- make directory
Creates a new directory.

DEL -- delete file/directory
Deletes a file or a directory (if it is empty).

REN --,-- rename file/directory
Renames a file/directory.

LMAR o left margin
Sets/displays left margin value.

RMAR o right margin
Sets/displays right margin value.

ECHO o batch-file echo
Sets/displays batch-file echo mode.

XIO *,*,*,*,--
special I/O command
Calls a special I/O command.
First parameter is command.
Second parameter is IOCB channel to operate through.
Third and fourth parameters are auxilliary 1 and 2 values.
Fifth parameter is device/file to do operation to.

LOCK -- lock a file
Locks a file (disabling it from being written to or deleted).
Aka "read only mode."

TYPE -- type a file
Displays a file onto the screen.
Switches are:
/I use input (legal only with files of records
(characters separated by end-of-lines)
made of less than 256 characters).
/X translate ASCII (legal only when not using /I
command).
Translates [^M] characters to end-of-lines and
ignores [^J] characters.
/E Editor off (displays editor command characters,
rather than doing the commands).

OPEN *,*,*,-- open a channel
Opens a channel.
First parameter is IOCB channel to open.
Second parameter is mode (auxilliary 1).
Third parameter is auxilliary 1.
Forth parameter is device/file to open to.

PAUSE o screen pausing
Sets/displays screen display pausing ("[More]"ing).
(Press [ESC] or [^X] at a more to disable most listings.)

NOISE o I/O noise
Sets/displays I/O noise mode.

CLICK o key click
Sets/displays key feedback click mode.

SPEED o repeat speed
Sets/displays key repeat speed value.

REPORT o system report
Sets/displays system report mode.

PROMPT o prompt
Sets/displays full/partial prompt mode (full displays current
drive/directory, partial displays drive only).

WRITE -- create file
Enter a file from the keyboard (editing works on one line only).
[^3] to end file and close (after a [RETURN] (end-of-line) only).

UNLOCK -- unlock a file
Unlocks a file, opposite of lock.

EXIT exit ScotchDOS
Return to Action! (if valid).

I forgot to mention the current switches for the DIR command:
/W wide directory - displays 4 column listing, with the
sector lengths not shown (like "/W" on MeSsDOS)
/D directories only - lists only those files that have a ":"
at the beginning (directories!)..

also, switches can be used in any order, so "DIR A*.*/W/D" is the same as
"DIR A*.*/D/W"...

411. HobbyTronic and QUICK

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-12 11:20:50 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Feb12.112050.10451@aber.ac.uk>
Source record: 108121

The HobbyTronic 92 demo (the camel bit!) works fine on my PAL 130XE as well. My guess it's the old NTSC problem again! HA HA! Us PAL guys have one over on you lot again!!

I very much think I have the HB 89 demo in my PD library. If it is, I will have it on the Archive soon. I also have loads of ABBUC/POKEY ones as well. If you lot are really after this stuff, I'll sit here all weekend and upload them if you want!!

Just another plug for the QUICK programming language. If you folks out there want to create demos of the HB quality without the headaches of 6502, then you NEED QUICK! Trust me!

I have made sure that we can make QUICK available in the US, and I have found a distributor on behalf of PPP. That means everyone in Germany, UK/Ireland, and the USA can get at it "locally" without need for sending money abroad. I have spent 30 hours editing and typesetting the English langauge version of the manual!

Also, the SAM 80 column desktop system for the Atari is also to become available in the US and UK at the same time.

Dean Garraghty. djg0@aber.ac.uk

413. 800XL system For Sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-12 15:11:09 UTC
From: adcock@bnr.ca
Message-ID: <1993Feb12.151109.5625@brtph560.bnr.ca>
Source record: 108123

I have the following Atari stuff for sale:

o Atari 800XL w/dust cover (I have added a locking
option key to save my index finger while loading)

o 1050 disk drive (unbutchered)

o 850 Serial/Parallel interface

o Zenith Color Monitor

o RF modulator

o Game paddles

o All Power Supplies and cables

Manuals:
O.S. Users Manual, O.S. Source Manual, Hardware w/ schematics,
850 Interface, Zenith monitor

Books:
6502 Hardware Reference, 6502 Assembly Language Programming,
"Your Atari Computer" Poole McNiff Cook, Atari Basic Programming

Software:
60 Disks many double sided including:

Microsoft Basic, Home Filing Mgr. , Deep Blue 'C', Ham Radio
stuff, AtariWriter Plus, Flight Simulator w/Manuals, Atari
Paint w/Manuals, Music Writer w/Manuals, XL Translator,Conan,
Strip Poker, Pole Position, and (Of Course) ton's of other
games.

Everything is in excellent condition and works perfectly.
I'm not sure what this stuff is worth but $150 + shipping
seems about right to me. Will take best offer.

Sorry I don't have email yet. Call (919) 991-7705 or write

417. Fun with dead 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-12 22:52:47 UTC
From: mute@bigwpi.WPI.EDU
Message-ID: <1lh9nv$h5g@bigboote.WPI.EDU>
Source record: 108126

I was recently given an 800XL and a wide variety of neato hardware
and software to go with it. Unfortunately, it has some problems.

When I power it up, it goes automatically into auto-diagnostic mode
and shows me the screen with the little squares representing memory
chips. The ROMs are okay, but the RAM is spotted with red squares.

Now, are these chips replaceable? I assume they would be if I had
appropriate replacements. However, I'd prefer not to replace all of
them, if I can absolutely help it. How do the little red squares
correspond with the physical chips?

Has anyone out there done this before? Could you give me any
assistance? I'd like to get this machine working sometime.

Thanks in advance,
Josh Brandt

An Atari 8-bit TrakBall can be modified to work as a mouse (in particular, an ST mouse). I've never done it, but I've seen them for sale, and there are instructions for doing the modifications in one or more text files floating around somewhere.

I use my TrakBall in joystick mode with Blazing Paddles (Illustrator program), when I'm placing text on the picture or otherwise want more precise postioning than I can get with my Koala pad (the cursor in TABLET mode "jiggles" back-and-forth by a couple pixels).

But, Dean... some things I DISliked about Quick when I started using it:

doesn't work (yet) on standard 1200xl. Not sure about 400/800, either.

editor supports 40 columns, ONLY.. no scrolling. Lines MUST be 40 cols.
or less!

But, I'm sure once many people've gotten used to it, etc.. we'll see just
as many includable toolkit-like files for it as we have for Action!

For now, I'll stick to Action! But once I start working on games
it'll be Quick all the way.
(i hope)

Well.. I'm a little confused about a issue 2 of _AC_, which just arrived
today..

it says "volume 2, #1"... so, was the premiere(sp?) issue the only issue
of volume #1?

_AC_ isn't going to go against the flow and do this:

issue called:
1 vol.1 #1
2 vol.2 #1
3 vol.3 #1

!?!??! I do hope not!?

:)

Well, I'd like to add (I guess, unless I don't have to, that I'll mail in these "Ts'n'Ts" via postal mail..?) that:

1) Not only can you use ESCALPAINT to colorize Gr.9 pictures, you can use Colorizer 1.1 (my PD program). It does it in a lower resolution, but it is PD, and when you think about it, the lower resolution (APAC mode, 80 x 96, rather than Przym/Int.APAC, 80 x 192) takes less memory, which in some cases may be more help ful...

2) Re: "Another AtariWriter-80 bug": I think in many word processors that [^A] is the standard key-command for "return to left of line", and I'm sure you may find that [^Z] will put you at the end of a line.

It's probably not a bug. It may not have been DOCUMENTED, which is another story, but I've used many programs (I think Quick is one, come to think of it!), like AtariWriter-Plus, which use the [^A]/[^Z] commands...

424. Finally..

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-13 00:51:45 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <ykXVyB6w165w@cyberden.sf.ca.us>
Source record: 108137

Quickly looking over the "keycode getter" article, I don't see anywhere
where it says that

A returns "whatever"
sh+A returns "whatever"+64
ct+A returns "whatever"+128
ct+sh+A returns "whatever"+192

OR that [ct+sh+A] returns 255!

So, if you were, say, loading a file, and accidentally hit a key,
just press [s^A] (shift+ctrl+A) to "clear the buffer".

just a note
not to be nit-picky! :)

hell, for all I know, it may explain this and I just didn't look closely
enough... :)

Oh yeah, one more thing... how about this in a program:

```
POKE 764,254 dunno what key it represents
REPEAT
IF PEEK(764)=255 THEN PRINT "DON'T PRESS [CT]+[SH]+[A]!!! >:^("
UNTIL PEEK(764)<>254
```

that way, a [CT]+[SH]+[A] WON'T break out of a loop, but anything ELSE
(except whatever 254 is) will..

just thot of that one day when I discovered what [s^A] did.

Also, for those of you with the game "Gemstone Warrior", try hitting [^1]
at the title screen! ([^1] normally pauses screen displays, but in this
instance, it does something sneaky :))

Sorry if this is a stupid question.
I want to buy a very cheap monitor for my atari, it could be
monochromatic and with no sound. But I don't know where to buy it,
nor where to look for it. I've been in some electronics store and it
seems that nobody carries this kind of cheap monitors.
Do you know any place (mail order) which handles this, how much
it would be?
I remember an ad in an Antic Magazine, but the last one I received was
about three years ago.

Thanks.

Juan Leon.

Bill,

Nope. The reason this issue is volume 2, number 1, is because this
is now 1993, and issue 1 came out in 1992. Make sense? Magazines
are ordered so that each year has a different volume number.

Just to throw in my two cents worth:

I am one of the people who sent their pledge in saying they'd subscribe. I also received a card saying "Thanks" and telling me I'd be told when to send in my money for my subscription. I never heard anything after that. The next thing I know, I'm hearing "Only 200 people signed up!". I am sending in a check for my subscription next week (to honor my commitment), but I think someone dropped the ball, because I never got the note saying "Send your money in!"...

Does anyone know of a good source for the 800xl RAM enhancements?

Secondly, I love my 800xl and all.. BUT.. THAT KEYBOARD! I have made several semi-educated attempts at replacing it, but it always ends up in the trash, and my 800xl is becoming very butchered.

Does anyone know of a replacement kit? Or does anyone have a schematic of the keyboard bus so that I may make another attempts (God help my 800xl)?

>is now 1993, and issue 1 came out in 1992. Make sense? Magazines
>are ordered so that each year has a different volume number.

Well, they don't have to do it that way. An example is the latest issue of
Tennis, which is Vol. 28, No. 10, Feb. '93.

It just depends on whether the publisher's preference is for Volume 1 to be
the first full year's worth of issues, or to be the issues released in the
first calendar year, the way AC chose. Who cares?

435. Parrot disk .. kaput!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-14 06:12:34 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <N47XyB4w165w@cyberden.sf.ca.us>
Source record: 108145

My Parrot disk is DEAD! (the poor bird)

humph... shouldn't joke about it, eps. since just Thursday I got leant a copy of a sampling keyboard "sample tape"... full of 121 1.5 second sounds, many of them that I'd like sampled on my computer (for the heckuvit, ya know?)...

grumble..

it seems the disk has gone scatty.. here's the deal:

Since I got my 256K RAMbo upgrade, I usually do the following:

boot up MyDOS (it's 1050 format is NOT the same as AtariDOS's (AtariDOS is what Parrot boots with))

create a RAMDisk and format it, copying MyDOS DUP.SYS to it...

pop in the Parrot disk in drive 1

copy the appropriate files from the Parrot disk to the RAMDisk
AUTORUN.SYS handles loading (and I do believe it
contains some sort of compiled BASIC
runtime package!? comparable to RUNTIME
from TurboBASIC XL!? Hmm... maybe they
compiled it with "ABC"...)
CODE an OBJect file, I guess...has the header
of "MMMMMM" and then some code (I could
tell by the "h" at the beginning)
SAMPLER the sampler program
EMULATOR the emulator (editor/keyboard player)

Then I change directory to "D9:" (the RAMDisk)

and tell DOS to load "AUTORUN.SYS" from it...

here's what USUALLY happens:

"LOADING PARROT" appears on the screen
drive 1 whirls for a moment.. this is the program checking for the copy protection (call it a hunch :) ... if I don't have the disk in drive 1, it crashes on me...)

here's what happens NOW:
"LOADING PARROT" appears
drive 1 whirls a bit...
drive 1 starts having a fit (sounds like when you have an un-formatted disk in the drive and are trying to read from it)

it retries the copy-protection check a bunch of times (takes a
few minutes for it to give up!)
and it totally dies..

Now, does anyone out here have a remedy for this? One of the ways I
first found that I couldn't copy the Parrot disk successfully was when I
copied all of the files onto a freshly MyDOS formatted and DOS/DUP'd disk
and it didn't boot... (back before I had a RAMdisk and knew I wouldn't
be able to run MyDOS AND the program without constant disk-swaps and
[RESET]s to get back to the DUP menu, so I could switch between SAMPLER
and EMULATOR)

or, even better... does anyone have a spare copy that they'd like to
donate!? :) ... or ... does anyone have a copy and also have a Chipmunk
or other "copy-or-die" type of upgrade on one of their drives?

Or...finally... (this question would most suitably go to Dean :))

how much does Replay cost... (or to anyone else) where can I find that
supposed text file that explains how to build a <$20 sampler, and comes
with sampling source?

(if worse comes to worst, I'll be able to make my own sample editor, or
check into DigiStudio ;) (wink wink))

thanx a bunch alll!

I feel so ... naked without my sampler!!! :)

Yes, I have a couple of issues also. I picked them up at The Summer
Consumer Electronics Show here in Chicago a few years back when Atari
was actually on the floor instead of squirreled away in suites. As I
recall they were in the packet of information meant primarily for dealers.
I think there was a form where you could subscribe, but I never did.

I remember it; I got the first two issues (Kay-bee was giving them away). I never saw any after that; but some of the upcoming games were pretty neat. Did Atari ever release Midi-Maze, Deflektor, or Ninja Golf for the 8bit at all, or are they just more sad examples of great programs never to see the light of day?

Don't be too happy, Quick hasn't the flexiblity of ACTION!,
also it has a very restricted memory management.

The most disadvantage is, that you can't use such simple
expression like a:=b+c, but must write add(a,b,c) ...
Quick supports as data types only bytes and words,
and if you want to program recursivly, stack overflow happens
faster than you expect to...

Ok, this is my personal opinion, but I've tried to program in QUICK,
and now, I program in Assembler again...
Perhaps it's the right language for Basic programmers ...l

```
Hi,

I've uploaded some demos to the archive today.

Now, a short description:

hobby90.dcm : Hobbytronic-Demo 1990 from A.B.B.U.C.
It's an enhanced Density Disk, so be sure to
set Maximum Sector in the Disk Comunicator to 1040.

wwonder.dcm : World of Wonders.
A nice sound demo, made with SoftSynth.
This is an enhanced Density Disk, too.

compyII.dcm : An older Compy-Shop-Demo from Peter Sabath.
This is a single Density Disk, so Maximum Sector is
720.

hobby91a.dcm
hobby91b.dcm : This is the Hobbytronic-Demo 1991 in a special Version:
You can select the single parts of the Demo in a Menu,
because not all parts will work on a NTSC-Atari.
Sorry guys, but with 60hz, vbi-time is too short.
These two disks are enhanced Density.

TheTop1.arc : The Top 1 Demo from Poland.

Our5oft.arc : Unity-Demo from Our5oft, from Poland, too.

Muaddib.arc: From Poland.

The article was printed in ANALOG's 8-bit Extra, which I no longer
own so I can't go into too much detail. Someome out there must have
a copy.

One neat idea I remember was advice on how to fly into a sector
containing a starbase and dock using minimal fuel. If you are
moving too fast, move your ship repeatedly up and then down
while flying forward--i.e. follow a sine wave toward your target.
It uses more energy than flying in a straight line so you won't
overshoot the starbase and have to turn around.

That's not completely right. Just include the MATH.LIB and you can use floating point variables, too. (Would you say, that "C" only supports integers?) And the STRING.LIB provides all routines known to "C" for strings, too.

>and if you want to program recursivly, stack overflow happens
>faster than you expect to...

Well, the "Towers of Hanoi" and the "N!" I programmed worked fine, although they were recursive. But certainly, you can't use local variables for recursion as they are static.

I know I posted this message before and got a few responses, but I lost
all info I had and that was a while ago so here goes:

I was wondering what sort of C packages are out there, and which ones
you think are best. I am a Unix programmer who extensively uses GNU-C
so I would like the C package to support char *name and also int *name
and all sorts of structures like that. Also if it supports Makefiles,
Includes Headers, and Function Pointers.

Well, actually, there is the fork() routine written for action!
which lets you run two processes at the same time, and even allows
you to specify which process, the main process, or the spawned
one, gets more clock cycles.
I don't know how to compare this with Quick's multitasking however,
because until the Quick magazine that shows how to multitask is
translated into English, it doesn't really exist for us.

In this letter, Juan Leon is looking for a monitor which would be a composite monitor. I too would like to acquire one somewhere. Now, I have heard this: IBM CGA monitor are this, but the pin outs are different. If you have a repair shop handly nearby, you should be able to obtain the pin outs from them and make an adaptor cable.

This is what I have been told, but I have yet to try it myself. If anyone out there know of a good monitor outlet, or has a color composite monitor they would like to sell, please write back to grh@nde.unl.edu.

BRIT,

Well, I think the one compiler which most supports those sorts of things
is CC65, but it doesn't have makefiles. The problem is, CC65 is really
slow when compiling and linking. If you can deal with having to wait
for the linker to churn away, you might want to look into CC65.

When I wanted a color monitor a couple of years ago, I went to a
local dealer that specialized in used computer equipment called Second
Source. At that time they carried used Commodore equipment as well
as Mac and IBM. The Commodore 1702 monitor is well suited to the
Atari 8bit. It accepts both composite and chroma/luma input (the
best resolution for the 130XE). I think Commodore had a later model
1803? that replaced the 1702. It wasn't super cheap, but I've been
quite pleased with it. Your best bet would probably be to find a
dealer who still handles Commodore equipment (or maybe scan the
Commodore newsgroup for equipment for sale).

NO! Don't get a CGA monitor unless it has dual inputs (RGB and Composite).
Very few CGA monitors have this. You need a monitor with Composite input.
You can't use a monitor with RGB input with ANY kind of adaptor (except an obscure 80-column board for the original Atari 800).

One person suggested the Commodore 1702. It's great. I have 2 of them (one for my C64, one for my Atari 800) and the picture is really, really good (no artifacting on text, etc).
You'll have to look for them used, and you should be able to find them for around $75 or less.
If you're really desparate, Commodore still sells the 1084, which is the Amiga monitor, which also has separated Composite inputs (also excellent picture quality -- but the retail price is around $329).

452. sparta and harddrives, or hard drive interface specifications

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-16 04:57:27 UTC
From: tgreen@iastate.edu
Message-ID: <tgreen.729838647@pv0a27.vincent.iastate.edu>
Source record: 108014

a rather technical question about hard drives:

I'm thinking about trying to design a interface similar to
the sio2pc, except using the parallel bus instead of the
sio, and connecting to the PC's parallel port. Why? speed,
I hope. Anyway, what I think I need to know is what is
the standard hard drive interface? what drivers are normally
present, and what does sparta look for to determine that
there is a drive present? I've read the articles on the
pbi, and what little info I can find on the generic handler
interface, but I'm still pretty clueless. The MyDos
source doesn't seem to treat harddrives as all that special,
so thats no help.

I bet this would be a lot easier if I had a hard drive,
but then there'd be no point :-)

Any tips or pointers to info or an expert would be
appreciated.

Todd

P.S. I thought the 2nd issue of AC was very good.
Nice job guys!

As I understand it, (not very well :), the SIO routines in ROM are written so that anytime there is a JSR $E459 instruction, it calls a routine in the PBI device's ROM if there is a PBI device; otherwise the command is sent through the serial bus. I'm not exactly sure how this works, but your best bet is probably to disassemble the OS.

Well, Compute! is owned by Bob "Penthouse" Guccione. In the Jan 1993
issue there is a full-color 2 page ad for some paintings by Mr. Guccione
(sort of abstract still lifes and nudes). What that has to do with computers
is completely beyond me. It is also interesting to note that Compute! is
starting to run quite a few ads for "adult" software: CDs full of GIFs
and "movies," the 900-number equivalent of BBSs, etc. Is there a connection?
Hmmm.

Source record: 108032

I have an 810 disk drive that was working fine for awhile, and then just quit working. No apparent reason. The drive power light still comes on, but the busy light doesn't and the heads don't turn, move or anything. I pulled out the side card and pulled off the metal shield. Underneath I found a load of chips. One of them is the ol archiver chip. But not having any chips to replace them with, or even knowing which ones might be bad, I'm lost.

Anyone know what I could do to test which one it might be, or would you already know which one? And where can I get it? Then again, the problem might be something else entirely.

Thanks for any help,
Curtis

That it did. From what I read, Ninja Golf was like any other golf game except that the golfer was a Ninja, there were other ninjas on the fairways, in the rough, etc who were trying to kill your ninja, and there was supposedly a fire-breathing dragon on the green (no easy putts here!). I wanted this game just to show my Genesis-owning friends that Atari still ruled in coming up with original games.

I hacked together a "make" for CC65 that read the SpartaDOS X directory for dates, figured out the minimal rebuild needed, and generated a series of chained batch files to do the calls to CC65, RA65 and LINK65. It even stops the batch file chain when an error occurs.

The problem is that all those calling of X.COM from SpartaDOS X will occasionally lock up the computer. It proved to be buggy enough to be undependable and I haven't gotten back to it to figure out why.

474. 65XE questions..?

Newsgroup: comp.sys.atari.8bit

From: miskines@acsu.buffalo.edu
Message-ID: <C2L0rw.DBy@acsu.buffalo.edu>
Source record: 108036

Ive just acquired an atari 65XE, and 1050 Disk drive.. I have no desire to use this in any high-powered apps, but would like to get it up and running as a project, of sorts..

First Question: briefly, what is it. I do know its a 6500 family processor, and probably has 64k or so.. but what other features make it interesting?

2nd Q: it lacks a power supply. A pinout, or suggestion as to where i could get one would be appreciated.

3rd Q: it lacks the disk drive <-> computer interconnect cable. Again, a pinout or source for such a cable would be nice. Side Q: I will assume w/ the 'Drive Select" jumber block, devices were daisy chained, using some interesting flavor serial protocol?

4th Q: A TV is alright, but a pinout for the monitor would be better.

5th Q: Software? I dont even have a disk-based opeerating system for it.. any kind soul out there willing to teledisk something up for me?

6th Q: might as well use it as a dumb terminal, if nothing else.. I seem to be lacking a serial port, however?

Thanks..

Here is a Wall Street Journal article about Atari founder Nolan
Bushnell's latest business venture.

The Wall Street Journal
Monday, February 1, 1993

Atari Founder Seeks To Break New Ground With New Software
* * *
Startup Firm Is Set To Launch Product Linking Phones And Desktop Computers

By Ken Yamada
Staff reporter of the Wall Street Journal

Nolan Bushnell made a fortune when he invneted the first commercially
successful video game called "Pong", and later founded video-game maker
Atari Corp. (correction- Atari Inc. -MNJ) Now he hopes to break new
ground with software that will tie together desktop computers and
telephones.
Since Atari, Mr. Bushnell has started several ventures, succeeding
in some, flopping in others. He is currently chairman of a small company
called Octus Inc. The San Diego, Calif., concern plans to publicly unveil
its first major software product this week, and begin sales in the second
quarter.
The software is targeted at corporations with moderate to heavy
telephone usage and will be sold through manufacturers and vendors of
computers and telecommunications equipment, Mr. Bushnell said in an
interview. He wouldn't estimate how well the software will sell, but
described the market for such products that tie togeher computers and
telecommunications as new and growing to "billions" of dollars during the
next three years.
Mr. Bushnell said the company expects in the second quarter to
announce the names of some of their vendors and customers. The software
will allow co-workers who answer telephone calls for one another to
exchange messages about the call on computer screens, refer callers to
different recipients via computer, dump calls into a voice mail system,
fax data and perform other functions, he said. The Octus software will
cost $500 a copy loaded on a desktop computer, he said.
Last month, Octus had an initial public offering that raised about
$12 million, Mr. Bushnell said. In 1992, the company was closely held and
wasn't required to disclose earnings. A spokesman said the company had a
net loss on revenue of $5.1 million for 1992, primarily on sales of its
laser printer equipment, which it is phasing out.
Equipment required to run the software includes computers using
Microsoft Windows, a voice mail system and telephone equipment called

Centrix, which is offered by various telephone companies, Mr. Bushnell said.
Stewart Alsop, who is familiar with the product and is editor-in-chief of Infoworld, a computer trade publication, said the new software addresses a growing need by businesses to integrate different electronic devices in the office. "Suddenly you can start merging all of the systems at your company," he said. But companies lacking the specific computers and telephones needed to run the software may find installation cost high because of new equipment costs, he said.
Octus software faces other hurdles as well. Such companies as American Telephone & Telegraph Co., and other software and computer concerns are developing their own versions of similar products.
A spokesman for Pacific Telephone, a unit of Pacific Telesis, said the Octus software is "definitely something we're interested in," but said the company hadn't yet made a decision to offer it to its customers.

(By the way, Octus trades under the symbol OCTS. It is around $5 a share -- MNJ)

Unfortunately, the golf aspects were very minimal. Basically, you
hit the ball and the game turned into a Double Dragon clone as you
walked toward it.

Source record: 108040

It's ME again! (I just LOVE disappearing!)

Well, I thought, wouldn't it be nice to have a Pal Atari.
I bought some old used 800XL from a used-stuff shop for about $3 (!!)
I cleaned it out thoroughly - it looks brand new. Only thing is, when I got to
actually borrowing a PS from a friend and
hooking it up, it just turns up with a black screen, and nothing else
happens. I know the GTIA whatever IS working, because fiddling inside
with a screwdriver (or a finger) changes the display, causing flickering.

My old 800 was in the same state for a while after receiving a BANG from
a drop onto the floor, but it was just a small chip of plastic that fell
of the memory boards, and interfered with the contacts, thus causing the
cold-start (upon turn-on) to crash. (Don't worry, I fixed it!)

Well, I think the 800XL might have the same kinda problem - but it doesn't
have those stupid memory boards, and nothing seems wrong.
Any hints? Helllp!

481. Questions About the February AC

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-17 22:54:37 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9302172154.AA26372@smithkline.com>
Source record: 108043

Bill-
Volume numbers for AC will follow the year. In 1992 we published only one issue (Vol. 1 #1, Dec. 1992). If we publish 6 issues in 1993, they will be Vol. 2 Nos. 1-6. Vol. 3 will contain all the issues we publish in 1994. Get the idea?

Joe-

Yup, you can subscribe to the disk at any time. If you subscribe now, you'll get the February disk & your disk subscription will be current, you won't miss anything.

If there are folks out there who just want the disk & don't want the magazine, hey that's fine with us, $9 will get you 3 disks/year. We aim to please, we got something for everyone here <grin!>.

Our next disk will come out in June. If someone who didn't originally subscribe to the disk decides in June to go for the disk, their disk subscription will begin with the June disk, not the February one. (Subscriptions to disk or magazine ingeneral will begin with the the "current issue", except in the case of the magazine where people were sent the free Premier Issue.) Once our June disk comes out, remaining stocks of the February disk will become part of our Back Issue inventory. Back issues of disk or magazine are available for $3 each, check payable directly to Ben Poehland.

Due to sluggish sales I instructed our publisher to cut back on the number of extra copies of our February print run. I'm now beginning to wish we had printed up an extra 100 or so, as subscriptions are picking up again & the extra copies are going fast. With our subscriber base still gowing by fits & spurts, I'm finding it almost impossible to predict 2 months in advance how many extra copies we'll need. If we order too few, new subscriptions are delayed getting started & there are no back issue copies available for latecomers :(. Order too many, & the magazine gets stuck with a printing bill for stuff that sits around & never gets sold (& AC loses money!). If anyone out there has a well-tuned crystal ball, please send it to me?

The only way people can ensure they'll get all the issues of AC is to take out a subscription. So far I've been able to service all new subscriptions with no problem, but I must say the stack of spares in my office is dwindling daily.

Incredibly, copies of the Premier Issue that was mailed out Nov.3 of last year are STILL being delivered! Yes, friends, believe it: the Premier Issue of AC reached Iceland on February 5! Unreal. And another copy of the Premier Issue has found its way to Russia (a computer store in Moscow) via an 8-bitter in France. I just got a subscription from Ireland (the Eire part) where no copies of AC were ever sent. I'm positively fascinated at how this strange little

magazine is slowly spreading roots all over the world. I never expected it.
This stuff freaks me out.

If I remember correctly, it is indeed a full-bus interface, but it is
definitely not PBI (as in 800XL) compatible. It was used for testing at
the factory and never really touched after that... Although I have heard
that a few various upgrades required soldering to lines on it...

>archives (a 60k file will come in 3 parts)??

First off, e-mail submissions to the Atari Archive are directed to Jeff Weiner at weiner@atari.archive.umich.edu. Since almost everything he sees is for the ST, it's very important that you specify the submission is for the 8-bit.

As far as splitting up the file, I would say just take your big uuencoded file and split it up with your word processor (if it has that big of a text buffer area). Then you would label your separate mail messages accordingly (part 1, part 2, etc.)

Off hand, I can't think of anything else to try.

Disclaimer: I am not affiliated with our Atari Archivists (John Dunning, Jody Lenn, Jeff Weiner, et al.).

The time limit on a copyright is the author's lifetime plus 50 years. But,
again, I doubt that very many authors would mind thier stuff being
distributed.

Hello Atari 8-bit users!

You don't know how welcome it was for me to discover your newsgroup, and to join. I have been reading only- just to get back into the swing of things. Some of you may have seen software that came from me under the name of Lord Quest- as they were traded worldwide.

I was an engineer for Atari until Warner decided to chapter 11 bankrupt the company in 1985. I along with about 4 thousand people worldwide were suddenly out of a job. I have many stories to tell if anyone has any questions- some really terrible, some really interesting- most unbelievable!

I still consider my time with Atari to be the best and most fun computer enginering experience of my life. Now I design and build AT to 486 systems, mostly without excitement. The Atari days were fun, anymore work is boring.

I have a few programs I wrote in assembly for the Atari that I could upload if someone tells me where the ftp site is. I saw something about an archive for 8-bit stuff in a message or two.

There are over 170 aspects of the Atari 800, 800xl, 1200xl and 600xl that I was responsible for. I also know lots of little secrets about the machine, and have a complete source listing (tho I believe that it was published once) of the Colleen operating system. I would be interested in a source listing for the Sally and the Freddy operating systems if anyone has them..........sq

(there are so many things I want to say- good to know that die-hard Atari users are still around!)

IMO: I've read the same article & I'd have to say I was a little less enthusiastic about it then you. I've heard rumors that Best Electronics may even have one of the beasties but haven't tried to confirm it.
A lot of stuff was done by the Warner vs Tramiel 'Atari that just got dropped when the 8-bit market dried up. *IF* there was really anything that the expansion module provided that you couldn't get in spades with some after market device like a Black Box then I'd be a little more concerned. It's a little bit a matter of tastes, but I'm happy with the current memory expansion schemes, expansion cabability, etc that I no longer worry about that kind of stuff. Don't look at Atari's failures as a negative, figure by dropping the ball they opened the door for other people (That both did it right & actually care!) to make a bussiness out of the 8-bit. I figure people at places like Percom, Astra, ICD, CSS, OSS, ad infinitum bought a lot of groceries by filling Atari Corp's voids.

494. Atari 800 4sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-19 02:01:54 UTC
From: danny@vega.iii.com
Message-ID: <532@vega.iii.com>

Cross-posted to: comp.sys.atari.8bit,ba.market.computers

Yes the old faithfull Atari 800 in prefect working order.

- Atari 800
- Indus GT disk drive (5 1/4 floppy drive) with Disk OS
comes with spreadsheet, word processer, and a database program.
- ATR8000 peripheral box. This enable you to hook up any printer
and those full height 5 1/4 disk drive.
- TV/Monitor switch to use any TV
- 810 Tape Drive!!!
- Touch pad with paint software.
- Joy stick
- Games - Flight Simulator, PacMan, Defender, Missile Command, JumpMan...
- Software - Deep Blue C, Forth Compiler, Atari Basic,
6502 Assembler, Paint porgram....
- lot of books from beginning to advance + Atari magazines.

Everything works. Give me an offer.

reply to danny@iii.com

How about arrays, pointers, or records/structs? C supports all these,
and ACTION supports the first two. Does Quick?

How about procedures and parameter passing? Do they work like they do
in C, Pascal, Modula-2, etc., or even like ACTION?

The Atari needs programming languages for more than just games.

499. 800XL System for Sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-19 16:13:35 UTC
From: adcock@bnr.ca
Message-ID: <1993Feb19.161335.25667@brtph560.bnr.ca>
Source record: 107761

I have the following Atari stuff for sale:

o Atari 800XL w/dust cover
o 1050 disk drive (unbutchered)
o 850 Serial/Parallel interface
o Zenith Color Monitor
o RF modulator
o Game paddles
o All Power Supplies and cables

Manuals:
O.S. Users Manual, O.S. Source Manual, Hardware w/ schematics,
850 Interface, Zenith monitor

Books:
6502 Hardware Reference, 6502 Assembly Language Programming,
"Your Atari Computer" Poole McNiff Cook, Atari Basic Programming

Software:
60 Disks - many double sided including:

Microsoft Basic, Home Filing Mgr. , Deep Blue 'C', Ham Radio
stuff, AtariWriter Plus, Flight Simulator w/Manuals, Atari
Paint w/Manuals, Music Writer w/Manuals, XL Translator,Conan,
Strip Poker, Pole Position, and (Of Course) ton's of other
games.

Everything is in excellent condition and works perfectly.
I'm not sure what this stuff is worth but $150 + shipping
seems about right to me. Will take best offer.

Yes, I now have email - yeah!

Welcome all who enter! I for one would love to hear any Atari trivia. I had a couple of friends who got knocked of in that same layoff (non-techie types though). Best rumor on OS source: although the 800/400 OS was/has been available for some time, rumor is the only good copies of the XL/XE OS were on one of 4 DEC PDP's at Atari. One of the first things the Tramiels did was sell off assets to raise cash including the DECs without retaining a copy. If you have anything other then the original 800 OS, it would be greeted with about the same glee as the Dead Sea Scrolls.
Rick

Hi,
I'm looking at the disassembly of a program for the 8bit Ataris and I have found a few addresses which I don't know anything about. Can anyone help with these:
Any special address in the Zero Page
$0200
$0201
This display list interupt vector. The way you use it is put your code in some safe area like page 6. Store the address of the routine @$230/$231, then add $80 to the display list line. A typical thing would be to change colors about 1/2 way down a graphics 0 via writing directly to a harware register. With this routine on page 6:
PHA
LDA #0
STA $D40A ;WAIT FOR HORIZONTAL SYNC
STA $D018 ;HARWARE COLOR REGISTER
PLA
RTI
Then store a $00, $06 at $200, $201
add $80 to the display list instruction the line BEFORE where you actually want the change to occur. From Basic it would be something like:
DL=PEEK(560)+256*PEEK(561):POKE DL+10,PEEK(DL+10)+128. Now just store $C0 @$D40E to enable the interupt.
$0230 $0231 Pointer to where the display list is located, can be modified to point to your own DL.
Any special address $0400-$04ff: These are used by the OS for I/O, the cassette buffer is here & I think the ROM disk routines use it as a buffer. This area is not really available for putting code *IF* you use the OS I/O routines. I posted a while back on using the buffers for inputing a number from M/L in a packet radio program.
$d004 horizontal position missle 0 or player 0 to playfield collision
$d005 horizontal position missle 1 or player 1 to playfield collision
$d007 horizontal position missle 3 or player 3 to playfield collision
$d00c player 0 to player collision
$d012 joystick 2 trigger or color P/M 0
$d016 playfield 0 color
$d017 playfield 1 color
$d018 playfield 2 color
$d019 playfield 3 color
$d01a color background
$d01f <START> <SELECT> <OPTION> buttons
$d20f ; POKEY serial port control/status. Pokey does everything from keyboard to potscan to most of the noises the computer makes.
$d400 Antic DMA control shadowed in ram @559

$d409 character base. If for instance in that code snipet above you wanted to have multiple character sets, this is the register to write to. What happens is the OS will stuff whatever is in location 756 into this register during the VBI so you only have to have location 756 point to the character set you want at the top of the screen then stuff this with the adress of the set you want on the bottom.
$d40a Wait for sync. Change the program above & leave it out to see the screen jitter.
$d40e DLI register, used above.

Thanks in advance. You're welcome. I may have left out a few things or made a mistake or two. Best thing would be if you could get Mapping the Atari or De Re Atari to double check.

The OS in the XL's checked for the option key to disable
basic right after all the memory and device address locations were
zeroed. The process to detect the option key from the moment the
power is turned on is only a few hundred milliseconds- less than
half a second. You don't even have to wait for the beeps!

Josh,

Memory is rare to die in the Atari. The item which DID
often go bad, and often did show erroneous bad memory in the self
test was the MMU (Memory Management Unit). It is a PLA
(Programmable Logic Array) or PAL (Programmable Array Logic)
depending on which coast you lived when they were developed. The
MMU is probably unavailable, but I might have one in my parts bin.
I used to collect Atari parts for my emergency backup- come the
day Atari no longer sold parts.

I may be wrong, Tramiel may provide parts, I don't know.
I would swap out the MMU before the memory. Also, don't worry
about the cost of replacing all the memory. They are only a
couple of bucks apice- and you need 8 total of the 4164 DRAM at
breakneck access times of 120ns minimum. Around here, I can get 9
chips in a Jimpack for about 10 bucks, and they be 80ns chips!

The MMU is a socketed chip, so if you have a friend close
by who will let you swap out that chip- do the diagnostic that
way. If not, get back to me and I will dig one up for you under
the condition that if it doesn't fix it, I get the chip back for
the next guy (or for me- who knows).

Good luck.............sq

Juan,

Any composite TV or monitor will work for the Atari. Many
use the Commodore monitors- as they look great with the Atari. I
am amazed that Atari never sold their own brand of monitor, but oh
well. Any apple compatable monitor will work as well.....sq

(just ask for composite input- you will need a special cable too.)

>
> Does anyone know of a replacement kit? Or does anyone have a schematic
> of the keyboard bus so that I may make another attempts (God help my 800xl)?

Jim,

I once made a serial mod for a laptop keyboard. The
keyboard I used was some kind of junk surplus serial keyboard I
got from American Surplus. The design was simple, the power for
the keyboard was pulled from the power out pin on joystick port 4
(I used 4 because it was lonely and never got used much). The
serial feed was sent back to the PIA through a couple of the stick
pins.

I wrote a small code routine that ran in blanktime out of
page 6 memory. It would reconfigure the two pins in question for
the Keyboard to use as serial I/O, then scan that PIA address for
key changes. I then stored that value directly to the keyboard
register high. I may still have the keyboard and code. It was
less than 256 bytes of routine for sure- it all fit in page 6.

> an adaptor cable.

Gregg,

CGA has separate sync and video- while composite has
composite sync (sync and video combined). You can't just short
the pins together to mix them either. I have built little
circuits to convert TTL to composite before, and could give you a
schematic. Mixing occurs in the nonlinear regions of a bipolar
transistor- and the results are good.

I can also give you a circuit schematic that will convert
composite signals to TTL separate sync. It does not STRIP the
sync, just decouples and provides it on the other line. The
pedistals of sync are "blacker than black" and do not effect the
picture quality. Either way, you can convert standart monochrome
TTL and CGA monitors to work with the Atari, C-64, Apple][, etc.

Should I (1) E-Mail the source, (2) Post the source, (3) Send the source to atari.archive.umich.edu? (I.E. is anyone else interrested?)

My system is an 800XL and I'm fairly certain that I have SDX 4.20 (definitely not an earlier version) The lock up happens when X.COM moves the display up in memory. Also, this has always been with the Time-Date line ON and executing X.COM from a batch file.

511. Atari cartridge copier?

Newsgroup: comp.sys.atari.8bit

Hi All,

Good to see a news group dedicated to 8bit Atari computers. I still have my original 800 with a Rana (introduced before Indus) drive... working!

Over in the game console world (Genesis, Super Nintendo), people are flaming over each over copiers.

I came across one for the Atari 8-bit computers several years ago. There was a utility that copied cartridges. The one flaw in the procedure was that the cartridge needed to be pulled out while the computer was on. Anyone remember/encourtered this?

Albert

(Nothing beats Star Raiders, MULE, and Archon on the 8 bit Atari!)

512. AC: Meet Me Half-Way?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-20 00:03:41 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9302192311.AA12537@smithkline.com>
Source record: 107774

Well apparently the discussions about AC have stirred up a few folks on the Net, it always amazes me how there are new people out there just discovering the AC thing even tho it's been going on since- when, Nov. '91? or so.

I've received a number of personal communications the past couple weeks from Net people inquiring about AC. I'm able to respond to about half those folks & have generally succeeded in satisfying their inquiries.

Then, there's the other half. *sigh* I REPly to those people, & the stupid VAXmailer at my site chokes on their email address. (Colin Hunt knows all about this, we been fighting it with not much success for like 2 years now). If you send me email from USENET, I can receive it but can't answer. If your address contains the word "root", I can't answer. If it contains a ! symbol, I can't answer those either. My mail queue fills with bounced replies, & all the things I've tried- such as coding thru the UUNET gate, end up just wasting my time.

The most depressing thing is, people don't identify who they are. No name. No alternative email address. No postal mailing address. There was one message in particular I found especially tantalizing, from a former Atari Engineering employee, which bounced. "SQ", whoever you are, please try again- & this time include your postal mailing address!

Guys, this is pure agony. If you sent me email & never got a response, please try again. Keep in mind the following:

1.) Don't assume I can communicate with you just because you can communicate with me. The Net is a strange beast.
2.) If you want info about AC, BE SURE to include your name & POSTAL mailing address. That way, I'll be sure to reach you by post even if I can't reply by email.
3.) Don't assume I'll know your email address from the header. Various gateways tack on all sorts of rubbish to headers, & I do believe Old Scratch Himself runs the mailer on our VAX mainframes here. Please place your email address somewhere in the text of your message, so I'll stand at least a 50% chance of answering you.
4.) If you send me email & receive no response whatever (even tho you included a postal mailing address), don't assume I'm ignoring you. Not all undelivered e-mail bounces. I personally have sent hundreds of messages which were neither delivered nor bounced, & the same could happen to you. These messages seem to lost in the "aether" somewhere, you know, wherever lost electrons go.

I do my best, but I'm sure the Net over the years can be blamed for many misunderstandings/hurt feelings, etc. [I once asked who owned the Net. The sysadmins here told me, "Murphy".] The botton line is, you can never

take the Net for granted.

Meet me halfway, folks, & we'll connect in the middle. That's where AC is.

513. Re: Atari cartridge copier?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-20 01:31:49 UTC
From: Jeff_M_Lodoen@cup.portal.com
Message-ID: <76073@cup.portal.com>
Source record: 107775

There were a few cartridge copiers for the 8-bit. One was a public domain BASIC program called CartCopy. It required an 800, and made use of the 'RIGHT CARTRIDGE' slot (hardly ever used).

I tried it out recently and didn't have much luck with it. I was able to make files out of a BASIC cartridge and a game called 'Webster'. Everything else locked up the machine. (Zone Ranger, Wizard of Wor, Deluxe Invaders, Robotron among others). Maybe the cart manufacturers planned for the simple attempts?

There was a commercial utility called CartClone that I saw advertised in an old Antic magazine. Looked to be a cartridge/disk combination. Don't know what the system requirements were.

I seem to remember having at least three different programs that claimed to copy cartridges. I will have to check my disks and if anyone is interested I'll try to figure out which one worked. I know that a couple of them were pretty bad and only worked sometimes but one was almost flawless.

If you want it... wanna know about it... post or email me.

520. Re: ScotchDOS (aka MyNI_DOS 3.0) variables!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-20 11:56:10 UTC
From: winston@merk.com
Message-ID: <C2qx5M.5zn@merk.com>
Source record: 107781

About your Scotch-DOS "ECHO" command... I hope ECHO doesn't behave in the same manner that Messy-DOS ECHO does, namely, that when you have "ECHO OFF" as the first line of a batch file, Messy-DOS would echo "ECHO OFF" to standard output. Honestly, I don't know what possessed the Messy-DOS designers to use the same command to both perform a verbose debugging execution trace --AND-- be used for explicit writes to standard output. You would think that they had never heard of using "TRACE ON" in BASIC or "VERBOSE ON" in an operating system and just about every early adventure game ever written. There should be some method for having quiet batch files with all diagnostic tracing turned off.

About your Scotch-DOS "CD" example... the CD command that I am used to will not simply back you up one directory level. CD without a parameter will set the current default/working directory to whatever text string is stored (well, at least it is displayed as a text string, although I do not know if that is how it is stored) in the "home directory" variable. If the "home directory" variable is empty, I believe that the CD I use would then default to the top level directory of the current storage device. For example, if I where at the "D8:GRAPHICS>PICS>KOALA>" and issued a "CD" without supplying parameters, and there was no declared "home" directory, I would jump to what is called the top level file system root directory, or "D8:". Thus, CD without parameters is used to make long backwards jumps quickly to the top of the directory tree structure, as a type of "short cut". These short cuts come in very handy when you don't want to waste time walking a directory tree structure. It allows you to always start at the top and work your way down in a uni-directional hierarchy. (This is just a thought; don't consider it as a request. I just tend to find MS-DOS annoying in its interpretations.)

Yes, I seem to remenber a simple program like that called util or PC-MYDOS (NOT to be confused with the 8-bit MY-DOS). IT was run on the IBM and could read 1050 DOUBLE DENSITY disks (single side). It's major BUG was that it only worked on a 360K drive on a PC. Also Sparta had a hard time with the Double density it produced.

Steve,

With CGA and TTL monochrome monitors being so popular these days, because PC users used to use them by the TON before EGA and VGA, these circuits you mention above have been dearly sought after by Atari 8 bitters for a couple years now. Please, write an article for Atari Classics or SOMETHING, so that the rest of us can use these monitors! I myself now have a TTL greenscreen IBM monitor just waiting to plug into my extra 1200XL....

I've got a 130xe with a mostly dead keyboard. After having done many evil things to the mylar, I figure it's time to get a new one. I remember a place best electronics (in california) that sold 'em. (I think I'll get a whole new keyboard rather than just a mylar, but they sold both ages ago.) Anybody got a # for 'em, if they're still in business, or another source for the keyboard/mylar? Or, if someone's got an xe for sale, I might be interested in buying it. (The 65xe used the same keyboard as the 130, didn't it?)

Dave

Note: I do not represent my employer or school, & sometimes not even myself.

Dave Archer | Internet: dmarcher@acsu.buffalo.edu
| Bitnet: V116KZND@UBVMS
| GEnie: D.ARCHER
| Prodigy: Surely you jest!

AMSTERDAM, THE NETHERLANDS (UPI) -- ASTERISK SHORTAGE PARALYZES NETHERLANDS. Strict rationing of asterisks has been imposed in Amsterdam today, as the shortage of the valuable ASCII character enters its third week. Residents are permitted to use only 74 "splats" per post, wreaking havoc in the city's reknowned .sig design studios. Used asterisks are fetching up to $7.55 apiece on some newsgroups. The imminent death of the net is expected.

St00pid user names, however, still appear to be readily available.

527. 1050 strangeness!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-21 18:02:01 UTC
From: wilmott@remus.rutgers.edu
Message-ID: <Feb.21.13.02.01.1993.21497@remus.rutgers.edu>
Source record: 107789

Had something very odd happen yesterday, and just wanted to see if maybe anyone else out there has experienced the same type of thing, or can explain *why* it happens. Here's the deal...

For the past 5 or more years I've had my 8-bit setup on a computer desk; 20" color tv monitor up top, to the left side of desk, and mono monitor on the right. On the desktop, from left to right were a case of disks, my 800xl, 2 1050 drives. Everything always worked just fine.

Well, I needed to rearrange things to make room for a newly acquired Mac, but I was certainly NOT going to give up my trusty 8-bit in the process. What I initially wanted to do was : up top, Mac monitor on left side, 20" tv/monitor on right. On the desktop, Mac on left, disks in center, 2 1050's on right. 800xl would sit on top of Mac case; I'd pull it out front when using it.

Hooked it all up, but couldn't get the Atari to boot up. Swapped cables, reconfigured drive #1 and #2, tried many disks, etc. but always got endless "disk error" and "No Dos". Assumption : the Mac is causing interference or something. Disconnect Mac and push it aside. No dice, still won't work. Finally, after **MUCH** trial and error, I've found the problem. If the 1050's are located under the *left* side of the tv, they WILL NOT WORK. (While they were located under the right side of the tv in my setup of the previous 5 years, they were fine). So fine - I can live with that, I've rearranged things and it all works harmoniously once again.

Okay, obviously the tv is giving off some kind of magnetic field in that location (transformer or whatever located on left side) and that is disrupting the drives.
What I *really* want to know though is :

1. Just WHY would the 1050's be affected so strongly? (the Mac is unaffected in same location)

2. If there is such a strong field under the left side of the TV, how come after 5 *years* of having my floppies stored in that location, I never had a floppy go bad on me?????

Sorry for the lengthy post, but I'm real curious about this one!

-Ray

In a previous article, anamr@cats.ucsc.edu (Ana M Rodriguez) says:

>
>I seem to remember hearing about a programmed that allowed the reading of
>Atari 8-bit disks in an IBM machine. I am looking for this program.

From the FAQ List:

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that
each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K
format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

These files are found on atari.archive.umich.edu in the
atari/8bit/Diskutils directory.

I remember CartCopy -- or at least a program that fits your description:
name, written in BASIC, public domain, popping carts in and out while
the system was running. I, too, was able to make a copy of the BASIC
cartridge on my first try, and was able to make NON-FUNCTIONAL copies
of the only other carts to which I had access at the time, Atari's CENTI-
PEDE and ASTEROIDS games. I say "non-functional" copies, because although
the files created by CARTCOPY were complete dumps of the cartridge ROM,
plus a little loader-and-relocator ML prelude, and would L)oad from DOS,
they didn't RUN. Well, at least not COMPLETELY. ASTEROIDS would show
some gibberish on the screen, and CENTIPEDE would show an inactive but
clear game-screen.

I was able to determine in the case of CENTIPEDE that the game code was
deliberately changing bytes at a couple of locations within the program,
so that a RAM-based copy of the program would be ruined and would not run,
but a ROM-based copy would be unaffected. That was the game's copy-pro-
tection, and once I NOP'ed out the offending self-modification instruc-
tions, the CARTCOPY'ed "file version" of CENTIPEDE came to life and worked
just fine. I posted a lengthy summary of the proceedings right here on
this newsgroup back in, oh 1986 or 87, which was when this all took place.

I never got around to investigating and trying to fix ASTEROIDS.

Oh, I also tried to CARTCOPY Atari's BATTLEZONE game cart when THAT came
out, whereupon I discovered that THAT cartridge contained something like
128K of code, in a many-pages-overlaid bank-switching scheme that I not
only couldn't copy, but which wouldn't even ALL FIT on a single-density
diskette, which was all I could handle at the time!

The conclusion is that the two cartridge-copy-protection schemes I've
encountered are a) self-modifying code (prevents RAM copy from running,
doesn't hurt ROM original) and b) bank-switching (works when cart is
present and banks can switch as intended; is Hell to emulate from a disk-
based copy.

IF you need XE term, I've still got my original copy but no
XM301.
If you send me your address I'll send it to you. I've also got a
copy of Antic that included a XM301 modem program in BASIC that
looks remarkably like Express (but came first I believe).
I think there's a short program to get the XM to U/L it's own handler.
Let me know if you just want me to post it here.

Well, what about using bank switched ram on an expanded XL/XE? (It would be
a neat experiment, at least!!)

On another note, I read over in Rec.video.games that Vectrex (rememeber
them?) has released all their games and are available via ftp for you to
burn you own eproms of them. What does everyone think the odds are for
Atari doing the same?

Or you could send me mail, and then I could add you to my Zmag distribution list. (Even though I haven't seen a new Zmag in months, if some of you have been wondering why you haven`t received any!!)

It works easier if you send me mail, then I have a better chance of getting mail back to you without bouncing!

Ok, dumb question here, what is the SLCC journal, and how can I get it or back issues. The ability to hook IDE drives to my XL sends shivers up my spine!! (Especially when you can get a 40 meg for $179.)

This also brings up something interesting. If someone was able to put there 800XL motherboard into, say a 1200XL case, would there be enough room to have an internal HD? Can a XL PS power the drive? (I don't know the pwoer requirements of IDE drives, but I wuold figure they wouldn't be much different from 5 volts.)

538. QUICK and SAM in the US

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-22 11:03:18 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Feb22.110318.14030@aber.ac.uk>
Source record: 107800

Somebody asked about prices for QUICK. Well, QUICK will be made available in the US as well. Prices have got to be finalised, but they are not going to be stupidly high like ACTION. I think at this time that QUICK will cost around $30 in the US. That'll get you the disk and 50 page manual. I will put details of prices and supplier details as soon as it is all finalised.

Also, the Screen Aided Management (SAM) 80 col. desktop system is also going to be available in the US for around $25.

BTW, it takes about 9 days for news items to get to here, and about the same to get back over to the US I suppose, so if people want info fast, then use email!

Dean Garraghty. djg0@aber.ac.uk

539. A little Internet-related FAQ...

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-22 12:21:11 UTC

Source record: 107801

Here's a bit of help for those troubled souls out there...
Does the "Host unknown" message strike you a bit too often.. even though EVERYBODY ELSE is using that very address?
Well, here it is! At last, a definitive guide for those with the "host unknown" blues!

(Why didn't >I< have an article like this one when >I< needed it??!!??)

Well, as most of you *might* know, I used to have many problems reaching various addresses, like Compuserve.com - namely, the "host unknown".

I solved this problem, by discovering the "double-address". I found out that mail to such messy places is routed through another host, even if it isn't specifically stated in the address. This "other" host CAN be reached by all users.
So, if you can't reach Compuserve, try:

####.######%compuserve.com@ihb.compuserve.com ..

The problem is that many systems require the "double-address" like the one for Compuserve, but it's not shown specifically anywhere.. Most "normal" systems (not the one I'm using) have a way of knowing automatically how to reach these places. Unfourtunately, such a database could get real huge, so many places don't have it. Which means, that if you see that EVERYBODY uses an address but only you can't reach it, try:

name%unreacheable.address@addr.that.does.work
where
"name%unreacheable.address" is the place you couldn't get to, with the @ changed to a % .
"addr.that.does.work" is the name of a host that DOES work from your place, and does have a database of all the
obscure double-addressing names. I found out that nyx.cs.du.edu does work, but it's a telnetable BBS so it's usually clogged. Just experiment with all kinds of places till it works.
Finding the double-address yourself will save the Net a bit more bandwidth, but you'll have to work a bit to get to it.
To do it, you have to look at the headers of a message you get FROM a user at that place, and look for line that looks like:
Received: from ------.----.----.--- etc etc etc etc
If the address in there is one you've never seen before, jot it down.
If you see several, go for the last one, but generally you should try them all. To use that address do:

name%addr.you.tried.toget@new.address

And that's it!

Itay,

If you look carefully, you will see that it is sawed off!
Initially, Atari had intended to provide "extra slots" and "extra
memory" to come out the back- but fear prevented us from doing
that. You see, at the time it was released, there were two basic
machines- the open architecture (Apple fame) and the CLOSED
architecture (Atari fame).

Computer phobia was at its peak at that time, and we
provided a machine that would be "user friendly" and safe. Of
course you and I know you can't get electrocuted from touching
address and data lines (you can only electrocute the chips inside
with static electricity). It was the brilliant boys in marketing
that decided upon sawing off the connector, and closing the box to
all future expansion. The future expansion slot was made
available on the XL and XE series- but little was done with it,
and NOTHING provided from Atari proper.

By the way, for those of you who have had frustrations
with the Atari 5200 joystick- know that it was not MY doing. A
salesman type individual decided to use the cheaper membrane
design- tho we in engineering decided to use Princess telephone
keypads and microswitches for fire buttons. Don't blame me- I
told them so!

Where is my "Mapping the Atari" when I need it! Well,
without my memory map, and strictly from memory- remember I
haven't coded the 8-bit computer, or even LOOKED at it for almost
8 years, but can remember one address which stands out- a common
call.

D01Fh or as in those days $D01F was the fuction keys
(start, select, option). If I remembered the address correcly,
that is. If you stored a value, it would beep the speaker, if you
read a value, it would give you the status of those
keys.........sq

> Rick

Rick,

All I have is the original Colleen- and I too would be
interested in the Sally, and Freddie operating systems. For those
who think these names are wierd, that is what we insiders called
the operating system- by name. The last operating system was
named Freddie for some unknown reason (after MY time).

I too heard that Tramiel didn't keep a copy, but I think
some of the software people, a guy named Miller I believe, could
have a copy- have no idea where any of these people are. Maybe we
should try to raise some of these "dead"? I am an ex Atari
employee, are there any others? It has been about 8 years now,
and I just happened to stumble upon this newsgroup by accident.
Tho I don't really use the Atari anymore- I still like the machine
for what it was (not what it is). It was a part of the happiest
days of my life, in Sunnyvale California, prime age (my early
20's) surrounded by techie nerds with the same burning interest in
computers. We were the beginning- and it was fantastic!

If I could go back and relive those days, I
would........sq

(a cross complier version might be available of all OS, but as I
said, I don't know where. The OS was never written ON the atari,
but on the DEC and cross compiled over to 6502 code......)

Okay, a couple things. First of all, last time I heard, about a month
ago, the IDE interface is FAR from perfected. The IDE interface has
a 16 bit datapath. Our 8 bits have a (duh) 8 bit datapath.
So Bob Woolley's interface ignores half the data coming off the drive,
meaning you get 40 megs from an 80 meg drive. Secondly,
While Bob has his home brewed hardware reading and writing sectors,
currently you can't hook up the hard drive, and boot DOS from it,
or tell DOS to copy files to it, or anything else. All he has
so far is is hardware and some code to read and write sectors.

That's not to say I don't like the work he's doing. the IDE break-
through is FABULOUS. It just has some more progress before
it's usable.

Regarding 1200XL with 800XL motherboards. I have both, and
the motherboards are the SAME SIZE folks. Ben Poehland can
corroborate on this. The only thing you would gain would be

a: better video via the Poehland Super XL Video II upgrade
b: built in Parallel bus (versus a homebrew one in the 1200XL)
c: standardized 27128 ROM socket.. (versus homebrew 27128 ROM socket)
d: built-in internal BASIC (versus homebrew added Rev. C BASIC)

you would have some additional problems, like trying to interface
the 1200XL keyboard to the 800XL, redo the holes in the back and on
the sides for all the ports, cutting a hole in the top of the case for
a cartridge slot. Putting a 800XL into a 1200XL case would end up
looking really horrid.

Out of ALL of those, the only thing the 1200XL can't have
that the 800XL has .... after a little work, is the terrific video

output from the Ben Poehland's video upgrade for the 800XL!
And I'm still elbowing Ben in the ribs, hoping that sometime within the next decade, our Managing Editor will find time to fool with his 1200XL.

You can fit an internal IDE hard drive into a 1200XL. Bob Woolley has a 2.5" by 1" high IDE hard drive inside his that he is using to prototype his IDE interface.
You can also fit in a 1200XL a 3.5" floppy drive. It requires some work, and in the future you'll see an article by me complete with photographs that will appear in Atari Classics showing just how I did it.

Happy computing folks.

Jeff McWIlliams

>

Someone on the staff of Atari Classics (not me, but I'll preserve his anonymity for now) knows Bob Woolley personally, and the last time Bob visited this person he had with him a 1200XL with an IDE drive mounted right inside the case. I don't expect that a standard XL PS would have enough juice to drive the drive but I suspect it wouldn't be hard to solve that problem. I mean if you can stuff an IDE drive in an XL case, the PS question would be trivial.

What are the chances of me tracking down a PAL 800xl in the US?
I think I can get it to work with my monitor, so I would to play around
a 50hz machine. (the only difference in power should be in the external
power supply... the supply output should be +5vDC anywhere.)

To you PAL users: How much does a used 800xl (or even a 65xe) cost in
your part of the world?

Source record: 107912

Ummm... I been watching this discussion about C for awhile, I was hoping someone would mention this, it looks like I'll have to do it.

The Feb. AC contained Part 1 of a long review/tutorial on C languages for the 8-bit. Part 2 is coming in April. The piece is slighly dated & doesn't contain info on developments of the past year or so, but is nevertheless a superb treatise for the C freaks out there, I think it would answer many of the questions I see flying around in the Digest.

The author I believe is considering a followup/update if there is sufficient interest.

Just my $.02.

Source record: 107913

There is no way to convert a CGA or MDA monitor to composite just by connecting some pins. TTL inputs & NTSC video are just two completely different critters.

The Commodore monitors mentioned by several people are excellent. I know a guy with a 1702, it's the puke-chocolate Commodore brown color but works fine. I have a Commodore 1902, also split-video input, same nice ivory color as my XL, also works great. You'll want to avoid the 1902A, it only has composite input not split video. There are several other monitor models by Commodore which look like the 1902 but have different numbers. No matter, they all work fine.

The Commodore monitors are all made by Phillips/Magnavox/NAP. You can buy used Commodore/NAP monitors from Toad Computers. Here's the contact info:

Toad Computers
570F Governor Ritchie Highway
Severna Park, MD 21146
800-448-TOAD
410-544-6943
410-544-6999 (BBS)

Toad also sells brand new Magnavox monitors with split video & CGA input, I think around $279. It's a grey thing on a swivel pedestal, same quality as the other Commodore monitors, would go nicely with an XE system if you're into the aesthetics. BTW these monitors can also be used with an ST or IBM, really versatile.

If you call the Toad Men, ask for Dave or Ray, those guys know this stuff.

Tell them The 8-Bit Alchemist sent you.

> needed to be pulled out while the computer was on. Anyone remember/encourtere
> this?

Albert,

I wrote a cartridge copy system for the Atari many years
ago. It was called the Atari Cartridge Imaging System. What it
did was copy the cartridge to low memory (page 40h) and save it
out in a dos file with a load header appended to it. The header
simply took the file after it loaded into page 40, and moved it
byte by byte to page A0 and jumped to the contents of BFFE to run
the image.

Later I got fancy, and wrote one that would look for
instruction nmonics that were like this assembly command
STA $B34D If it found a byte that equalled the nmonic for STA,
it would look at the second byte after it, and if it was greater
than $9F it would nop all three. It fixed the protected carts.

Needless to say, I made MINE so you didn't have to
whamma-jamma the cartridge into the computer with the power on!
It worked this way, you held down the start, and turned on. It
would beep to load a tape, you then hit return, and waited for
timeout to boot the disk. At that point, you would load the cart
copy program, and press start. The cartridge was already inserted
with the power off before you began this proceedure. This worked
on many carts..............sq

(try it yourself- if you put a game cart in, hold down the start
key, turn it on, then hit return and wait for the timeout, it will
boot the dos disk. At that point, you can load the cart copy
program and dump the image to disk. Very nice....)

((I should tell you all about disabling burst I/O in Dos, to make
Dos a cartridge copy system!!!))

> 1. Just WHY would the 1050's be affected so strongly? (the Mac is
> unaffected in same location)

OK, This is the problem. The monitor is kcking out tons of RF interfearance. This is getting into the cables and making it not work. However, it's not strong enough to get at your disks and cause them any harm.

> 2. If there is such a strong field under the left side of the TV,
> how come after 5 *years* of having my floppies stored in that
> location, I never had a floppy go bad on me?????

The Mac doesn't have the SIO cables, therefore, the RF doesn't get into them causing it to mess up.

As stated previously, I'd rather sell this as a set (one unit).. I dont enjoy the idea of shipping out 10 devices all over the country..

As it stands now, I am putting up these two systems as SETS only..no parting out..

Atari 800xl w/256k ram and freezer switch
Percomm drive with 180k mech and 360k mech (both half heights), also has two printer ports..
13" mono monitor
P:R: connection serial/parallel interface

Atari 130xe (stock)
2 x Atari 1050 dual density
Atari Sx-212 modem
P:R: Connection serial/parallel interface
MicroPrinter printer interface
Hayes SmartModem 1200

For the 800xl setup, I'd like to get around: $250 + shipping

For the 130xe setup, I'd like to get around: $250.00 + shipping

I am open to offers.

The Korner BBS, an Atari 8-bit tradition for upwards of 8 years has gone down after a severe hard drive crash.

I was trying to install a Syquest 10meg cartridge backup drive (to ironically perform a long-overdue backup), when the syquest failed and wiped out the hard drive.

Needless to say, I lost 140meg of JUST Atari stuff, not to mention the BBS, its core and all assisting files.
IF I decide to put it back online (either using Pro! or switching to Carina), it will still take upwards of several weeks. Please do not call until I post a message stating otherwise.

For a second I wondered why you didn't just save the cartridge from
ROM directly, then I recalled the rather silly DOS policy of writing
the sector link bytes DIRECTLY into the area of memory being saved,
then restoring the bytes after the sector was written. Kludginess
at its best...

> Needless to say, I made MINE so you didn't have to

To me, the most notable one this technique DIDN'T work with was
Star Raiders. Clever folks, making the cartridge run from the cart
init address instead of the cart run address. As I recall, the order
of initialization upon power on was

misc os stuff -> cart init -> tape/disk boot -> cart run

Ah, the days of 8-bit hacking. I remember hacking my disk copy of
Star Raiders to work on my 800XL was a bit tricky because it subtly
(unintentionally) modified $D40E, which swapped out the OS on the
800XL. Had a heck of a time finding the offending bit of code, since
it was an indexed store (STA $D400,X), and this was my first time looking
for such information in a program.

I managed to copy Gyruss somehow. I think what I did was booted up with K-DOS, then plugged the cartridge in carefully, then dumped the memory area to disk with the K-DOS Save Binary command.

Then I constructed a binary load file with the cartridge data followed by a run-immediately init routine that buzzed the internal speaker until you hit the Start key, then vectored through system reset. The buzzing was a prompt for me to flip a switch that I installed on the third 16K memory board which "write-protected" it.

10 years ago I had a hacker friend who had an Axlon RAMdisk modified out to 512K, and he had the ability to reset his machine and boot off the RAMdisk. That is how he cracked games.

Today, what we need to preserve our decaying 8-bit disks, is something similar, but which has a cable that plugs into a card that plugs into a PC. That way we can keep disk images on a PC, which can be kept on a hard drive, backed up to tape, FTP'd, etc.

Anyone have any ideas on how we can get such a thing made?

Sean,

Hmm, very interesting. If I were you, these are the things I would try
if I had the resources. I do, but I won't assume that you do.

Try to use one of the 3rd party OS chips that have a built in translator.
These would include the Omniview 256, Omnimon XL, UltraSpeed Plus OS,
Allen Macroware's OS chip.

Does it use BASIC? Maybe that is the problem. Might want to try using
a BASIC cartridge, or get your 1200XL modified with Internal BASIC like
the 800XL.

Does the printer work with everything else, or is it totally dead with your
1200XL? If it won't work at all, it might be the current limiting resistor
on the +5v line of the SIO port.

Mike,

You just described the SIO2PC interface. Look in Vol 2, issue 1 of
Atari_Classics for details, or look for some files at
atari.archive.umich.edu

Does it allow booting of full-disk non-DOS unprotected games?

Is it transparent to the 800; i.e., does it work without software
running on the 800 side such that you can "switch disks" when necessary
(e.g., inserting a new AMS data disk, or inserting the next disk in a
multi-disk adventure). And isn't the SIO port slow? Wouldn't it take
90 seconds to transfer a 90K disk?

Hello gamg. I was told from the ST group the here would be a better place to post my questions.

Ok, I just got an Atari 7800 and I'm looking for reviews fo the following games:)specifcally how well they look on the 7800)

1. Alien Brigade
2. Xenophobe (I really like the arcade game, so I must know about this one!)
3. Choplifter
4. Dark Chambers
5. Dig Dug
6.Ikari Warriors
7. Joust
8. Midnight mutants
9. Motor Psycho
10. Planet Smashers
11. Mario Bros
12 Scrapyard dog
13. Super Huey
14. Ace of Aces.

Also, I'm toying with getting an 8-bit Atari computer to play games on (like, what else do I do?)

1. Which one should I get?
2. What should I get hard ware wise?
3. Where is a good supply of stuff?

Thanks

Rob Merritt

573. ATARI 8BIT SALE CHEAP!! Also Disk Drives and 850 Interface, Software etc. etc.

Newsgroup: comp.sys.atari.8bit

For sale my loved and trusted Atari.

I'd like to sell it all at once
but I'd consider breaking it up.

To encorage people to buy the whole
thing I'm making this offer.

Buy one and get everything else Free!

Yes that's right!!

Buy an 850 interface(serial/parallel)
and get a couple of disk drives and
a 400 etc. for free.

$150 + shipping OBO takes all or part!

If you don't want it all I'll
consider auctioning it off.

Atari 400 with 48k and
full stroke keyboard and
Fastchip. (faster math etc)
The keyboard is home built.

Atari 800 doesn't work
(I use it for spare parts)
(I was going to add 256K
to it but, Hey.)
(Humm I guess no one wants
this)

810 Disk Drive
Single density.
Archiver

1050 Disk Drive
Enhanced density

850 Interface
with 4 serial (RS-232)
and 1 parallel printer port

I will include a modem and
a Centronics parallel
printer cable if you buy this.

810 Tape Drive
1% resistors
Improved reliability

Omnimon Hardware built in
program Monitor.
Allows you to see what's
happening in your ram
Fits on your ROM and can dump
your program to disk.
(uninstalled)
(I don't know if it works)

Monitor (converted color TV)
only runs on channel 3.
This TV has been modified heavily.
(Included Free)
(you might not want this since
it is kinda dangerous
The yoke sticks out the back
and if a kid or pet should
touch the yoke
50,000 volts!!
=:0
Don't get this unless you don't
have kids and pets that you want
alive.

A big box of disks.

[About 100-200+ ??]
almost all have programs on
both sides.

Basic Cartridge
also pac man asteroids games
Manuals

6502 assembly language
BASIC
COMPUTE atari books
etc.
Magazines
Softside etc.

To get in touch with me
The fastest way is to email me an
offer.

574. Atari 1450XLD???

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-24 17:00:00 UTC
From: menees@utkvx.utk.edu
Message-ID: <24FEB199312001513@utkvx.utk.edu>
Source record: 107936

Does anyone know if the 1450XLD was ever released?? I saw an announcement for it in Atari Age magazine (the same mag that announced the keyboard and disk drive for the 2600) about 10 years ago, and it looked so cool. It had 256K RAM, 2 built-in floppys, and a built-in speech synthesizer. I would love to have this machine! So did it ever exist, or was it merely another in the long series of Atari announcements that have kept me salivating for the last 10 years? advTHANKSance.

FYI: rec.games.video would be better.

>Ok, I just got an Atari 7800 and I'm looking for reviews fo the following
>games:)specifcally how well they look on the 7800)

Warning: In general, the quality of a 7800 game is directly proportional
to it's age--i.e. the older the better.

>1. Alien Brigade

A first-person "gun game". You move a crosshair and blow up various
monsters. Never played it.

>2. Xenophobe (I really like the arcade game, so I must know about this one!)

Haven't played it, but I've heard it's very mediocre.

>3. Choplifter

Blah. It's Choplifter I guess, but it doesn't feel as nice as the
original Apple version. Many of the elements seem rushed and would
have benefitted from additional polish.

>4. Dark Chambers

A version of the old classic Atari computer game Dandy, which
was the inspiration for Gauntlet. Not nearly as good as either,
unfortunately. It gets better with two players.

>5. Dig Dug
>6. Ikari Warriors
>7. Joust

Excellent, excellent, excellent. Exactly like the coin-op, right
down to the sound effects, except that the pterodactyl looks like
a flying alligator. Highly recommended.

>8. Midnight mutants

Solid Nintendo-style game with bosses and stuff, but surprisingly
isn't that bad. Probably the best of the later releases. The
game features "Grampa" of The Munsters--I'm serious.

>9. Motor Psycho
>10. Planet Smashers

An uninspired Galaxian clone. Very difficult. Some people really seem to like it.

>11. Mario Bros

Excellent rendition of the coin-op. The speed is a little off and some of the animation is missing, but the play is still there. The only significant omission is the Dripice.

576. XM301 <> 1200XL?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-24 17:29:00 UTC
From: v462etnn@ubvmsb.cc.buffalo.edu
Message-ID: <C2yr6A.3sz@acsu.buffalo.edu>
Source record: 107938

I've just read somewhere that the XM301 modem won't work with
the 1200XL. Any idea why? I read a posting earlier today
that mentions a current limiting resistor on the serial port --
which one is it and can I remove/jumper it to make the 301
work on a 1200XL?

Also: does the 1200XL have basic built in? Has anyone used
a Omnirom 256 with the 1200?

I ask all these questions cause I have a 256k 800xl that I
plan on cannabilizing to a 1200 I'm getting. My 256k
upgrade includes info on installing on the 1200, but the
Omnirom makes no mention of the 1200. I'm assuming
(perhaps incorrectly?) that Basic XE will work on my souped
up 1200.

Any ideas?

Yes, it is totally transparent, a SIO cable goes into a little box, with
another cable coming out the other end that plugs into the RS232 port of your PC

>And isn't the SIO port slow? Wouldn't it take
>90 seconds to transfer a 90K disk?

I can't tell you that, you should talk to somebody who owns one. Since the
PC stores the floppy disk image in RAM, it'll certainly be faster than
any 810 or 1050 disk drive you've used, because you don't have to wait
for the read/write heads to step, and for each sector to spin around
until it's underneath the head. But whether it takes 90 seconds or
19 seconds to read/write a full 90K disk, I can't tell ya.

>Bill Menees

Bill,

I think there are one or two complete 1450s out there, Bob Woolley I think
has one. There were also some 1450XLD motherboards floating around.
An acquaintance of mine just purchased one from somebody else.
From what I understand, there was a large batch of them made and ready to
ship in the factory in the far east. Atari tried to renig on the price
of the production or something, and the manufacturer got pissed and destroyed
them all or something horrible like that. Anybody else that can confirm this?
Steve Quest - what do ya know? As a nostalgic machine, it would be great,
but if you're looking of one for the superior 8 bit technology it offered,
you could do ALOT better with a Newell 1 meg RAM upgrade, and a Black Box
with Floppy Board for a 800Xl or 1200XL. Of course, that wouldn't give you
the speech synthesizer, what can I say?

David,

Find R63, it should be up there somewhere near the SIO port. Either short across it, or replace it with a jumper. That'll solve the XM301 modem problem.

THe 800XL uses a 47128 16K ROM to store the OS, the 1200XL uses two 8K ROMS instead. Bob Woolley has a modifiction, consisting of desoldering one of the 24 pin sockets, replacing it with a 28 pin socket, and moving some jumpers to accept the 800XL type OS ROMS, including the Omniview 256. Additionally, if you follow the upgrade further, the extra 8 K socket can be used to install the 800XL rev C BASIC ROM for internal BASIC, which works exactly like the 800XL.

What you need:

Good desoldering/soldering skills
some small gauge wire - 24 to 30 awg
28 pin dual side wipe IC socket
800XL MMU chip.
An 800XL type OS ROM (your Omniview 256 one would be fine)
800XL type internal BASIC ROM. Your 800XL came with Rev B, might want to think about Rev C if you program a lot... else your BASIC XE in the

cartridge port will work fine as well.

I don't know if you should cannibalize your 800XL just for the sake of the 1200XL though... gee, I would feel real sorry for the 800XL. What did it ever do to you (sob! Sniff!)

All silliness aside, if you're worried about not being able to find the parts to go into the 1200XL, BEST Electronics has everything you need. Your 1200XL also doesn't have the parallel bus that your 800XL does, in case you want to hook up the Black Box sometime in the future. Well, Bob Woolley has an upgrade for that as well, but it's a little nastier since you gotta run 50 some odd wires around to get all the outputs for the PBI port. On the other hand, that 1200XL keyboard can't be beat, and there's lots of room under that big case for all sorts of juicy upgrades and custom hardware and stuff.

Jeff

580. Atari 815 drive for $250

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-24 19:03:07 UTC
From: mfolivo@sactoh0.sac.ca.us
Message-ID: <1993Feb24.190307.1454@sactoh0.sac.ca.us>
Source record: 107942

I want to ask this of the net. I have been offered an Atari 815
dual disk drive for $250. Is this a good price?

It looks to be in good condition, although it has turned yellowish.
It even has the manual for it.

For those who don't remember, this was a rare drive to begin with,
think two 810 drives on top of each other, with write protect
switches, and more status LEDs. As I remember, it used a rare
version of Atari DOS, 2.0D, for double density. Is that right?

Source record: 107943

Along with the 815 drive, someone has given me a lead on an Atari 1450XLD. My question is what is the going price for these little gems?

I was told that someone has a 1450XLD with TWO of the double-sided parallel drives installed.

The wierd double sided drives don't concern me at all, since I still use Atari DOS 3 with my 1050s, and the XLD drives were designed with DOS 3 in mind.

So what is it worth? $250? $200?

In addition to the two complete Atari setups, I also have for sale
something of interest to hard drive owners:

Syquest 5 meg cartridge drive with three 5 meg carts..

System is slightly smaller than a 5 1/4 half height drive mech and
functions and installs just like an MFM hard drive (306 cylinders at 2
heads MFM) and the carts look like wider versions of 3.5inch disks

Accesses at hard drives speeds and is very useful as a backup device or
even as a direct access hard drive or even a high capacity floppy.

If you're interested, I'll take the first $65.00 or best offer. I'll
consider interesting trades of hardware/software also...

>David Anderson --- v462etnn@ubvms.cc.buffalo.edu

I must say, it never ceases to catch me by surprise when someone tells me they've never heard of Bob Woolley and some of his terrific upgrades he's done to Atari 8 bit hardware, especially his 1200XL modifications. And nothing makes me happier than further enlightening the 8 bit community and letting them in on these "secrets".

Bob Woolley is the President of the San Leandro Computer Club (SLCC) out in California.
You can write to him C/O the club at:

SLCC
P.O. Box 1506
San Leandro, CA 94577-0374

Now, Bob sometimes has difficulty answering people's mail, and other times he's simply terrific about it. I remember one time he commented he found letters on his desk, unanswered, dating to more than 6 months ago.
Then there are times when I've asked him for a 1200XL schematic or something and he gets it to me in less than a week. If you have trouble getting through to Bob, he's awfully busy, I can provide copies of the aforementioned upgrades. I even do them on special occasion when there are people who don't know which end of a soldering iron to hold on to. If you want copies of the upgrades, taken from issues of the SLCC Journal, send a SASE to

Jeff McWilliams
2001 G Woodmar Drive
Houghton, MI 49931-1017

Be sure to state clearly, and legibly, what it is you are looking for.
Usually I am pretty good at getting stuff out, especially if a SASE is provided, cause then I don't have to run to the post office. That's a pain for me, my wife always has the car! (grin)

I've been doing some 1200XL work myself, and a couple issues from now, you 1200XL fans should see some good stuff in Atari Classics, from the Moonlight Workshop.

Hang in there... we'll get you all caught up with the latest mods, fixes, and upgrades one of these days!

Jeff McWilliams

590. 3 CC65 Utility packages uploaded to atari.archive.umich.edu

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-25 02:25:18 UTC
From: tribe@ted.cs.uidaho.edu
Message-ID: <C2zG27.9EA@moscow.uidaho.edu>
Source record: 107952

I have uploaded 3 .arc files to the atari/8bit/New dirctory at the Atari FTP archive: fp65.arc, xebank.arc, and cc65make.arc. FP65 gives CC65 an almost complete set of floating-point math functions. XEBANK gives CC65 direct access to the 64K of XE memory. CC656MAKE is a mostly-debugged automated project builder for CC65 with SpartaDOS. It will take a while for the archivists to make the files available.

Some excerpts from the documentation:

FP65/FP65DOC.TXT:

OVERVIEW

FP65 provides C functions that manipulate floating-point (FP) numbers using the code and data format of the Atari ROMs.

The FP65 functions are in the object library file C0F1.OLB which replaces the file C.OLB from the CC65 distribution. The functions are:
fcmp Compare two floats
fcpy Copy floats
atof, ftoa ASCII-float conversion
utof, ftou Unsigned integer-float conversion
itof, ftoi Signed integer-float conversion
fadd, fsub Add, subtract floats
fmul, fdiv Multiply, divide floats
exp, exp10 Raise e (2.71828...), 10.0 to a power
log, log10 Find natural (base e), common (base 10) logarithm
pow Raise a float to a power
sqrt Find square root of a float
hypot Find hyponenuse given length of two sides
sin, cos Find sine, cosine of an angle
floor,ceil Find nearest whole float equal or less, greater
frac Find fractional portion of a float
fabs Find absolute value of a float
poly Calculate float polynomial
fperror Control error behavior

XEBANK/USERMAN.TXT:

OVERVIEW

This package provides CC65 programs access to the 64K of extended memory in an Atari 130XE or compatibly-expanded Atari computer as a single alternate memory space. Although the access may be slow, the routines enable C programs to perform many new and larger tasks.

The package consists of several .OBJ files that must be linked
immediately after RUNTIME.OBJ:

XCORE.OBJ Contains a routine to check for the availability of XE
memory, and utility subroutines that are used by all the
other routines. This object file must be used; the rest
may be used as needed.
XDYNAMIC.OBJ Contains routines that allocate blocks of memory for
use, or release previously allocated blocks for re-use.
The memory blocks can be allocated and released in any
order.
XACCESS.OBJ Contains routines that reference and optionally assign
the primitive C data types integer, character, and
float.
XSTRING.OBJ Contains routines that find the length of a string in XE
memory, compare a string in main memory to one in XE
memory, and set a value to a range of XE memory.
XTRANS.OBJ Contains routines that transfer blocks of bytes to and
from XE memory.
XFILE.OBJ Contains routines that read directly from a file to XE
memory, or write directly from XE memory to a file.

CC65MAKE itself has no documentation, but it includes the program "MORE.COM"
which behaves like the Unix more: multiple filenames and wildcards are OK.
It also includes some useful .OBJ files:

direntc - get raw dir, cache version requires xio, memcmp
inlist - find str in list of strings
memcmp - compare memory
filname - minimal rawname to file name
dirname - minimal rawname to sub-dir name
putstr - put string(s) to stdout
strrchr - find last chr in str
xio - extended I/O (DOS) access

I hope people find these files useful. For the time being, I can be reached
at tribe@ted.cs.uidaho.edu.

591. For Sale..

Well, lost my BBS hard drive for the last time. I'm calling it quits.
After running an 8bit Atari BBS for 8 years, I'm finally closing up
shop.

I'm selling my version of BBS Express Pro! 3.2c Ansi.

Package comes complete with networking module, on-line term program,
tons of @ircular Logic games, Power_main, File transfter protocols, the
whole ball of wax.

Original cost of all those packages would normally equal around: $400,
but I'll let this node and software go for $100 flat!

592. Re: Atari cartridge copier?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-25 03:12:54 UTC
From: Chris_F_Chiesa@cup.portal.com
Message-ID: <76400@cup.portal.com>
Source record: 107954

Since the always-interesting-to-me and not-seen-here-for-a-long-time cartridge-copying thread seems to have come back to life, I am moved to repost the following, which I posted here on June 6, 1988 -- four and a half years ago!

I note upon rereading this that some of the conclusions I drew from the statements of others were somewhat naive; I would conclude differently given the same inputs today. I'll be happy to discuss this in detail if there's an interest.

Subject: Cartridge Update - Centipede, Battlezone
Keywords: ROM RAM 16K Cartridge Bank
Message-ID: <3215@bsu-cs.UUCP>
Date: 6 Jun 88 00:21:14 GMT
Organization: CS Dept, Ball St U, Muncie, Indiana
Lines: 120

In a recent series of articles here, I discussed my explorations of Atari's CENTIPEDE game cartridge, vis-a-vis making a disk-based copy for self-educational pruposes. At that time, I had been able to copy the 8K of data from cartridge ROM to disk, load the same data back into RAM at the original addresses, and get a "partial" execution of the "intro" portion of the program. Attempts to continue on into the "game" portion of the program resulted in system freeze-up.

I asked for suggestions as to why this might be happening, i.e. what techniques Atari might have used to discourage RAM execution while allowing ROM execution. Thanks to all who responded, especially Hans Breitenlohner (hans@umd5.umd.edu), Ray Wilmott (wilmott@topaz.rutgers.edu), and Andy A. Lee (alif+@andrew.cmu.edu). After printing, saving, and absorbing (!) your comments, I'm pleased to announce that I was finally SUCCESSFUL in getting that disk version running.

In the interest of helping others as I have been helped, here then is a brief summary of what I found in CENTIPEDE. Following THAT, I will also comment on the results of similar investigations into the new BATTLEZONE cartridge.

CENTIPEDE:

Centipede turns out to be an 8K cartridge, performs NO esoteric bank-switching or relocating, etc. Execution occurs within the standard left-cartridge (400/800; the ONLY cartridge, XL/XE series) address range of $A000 - $BFFF. One of the first things the program does is to establish its own Vertical Blank Interrupt service routines, which appear to be concerned in part with shadowing console key readings ($DO1F-- CONSOL) into RAM. This incidentally locks OUT such standard functions as keyboard-reading and the like, making single-step debugging more or less impossible (analysis proceeded by looking at static disassembly output).

Protection is implemented at two separate points in the code. The first comes at address $A087, where LSRs are performed on data within the cartridge space itself. The address being LSR'd turns out to be the entry point for the main game-playing routine; if the program is executing from an inserted cartridge, the LSRs have no effect on the data/code being LSR'd -- but if it's executing from a RAM copy, this effectively "trashes" the code at that address. The second line of defense (so to speak) appears around $A151, where once again an LSR is performe on cartridge-space memory. This time, the data BEFORE the LSR is compared with that AFTER the LSR, determining quite neatly whether the environment is RAM or ROM; if ROM, a JSR is performed to what seems to be the main game routine; if RAM, a JMP is performed to the SAME address. The JMP, of course, fails to stack a return address, and when execution hits an RTS, there's noplace to return to -- I imagine execution ATTEMPTS to continue with whatever follows the "jump to loaded application" portion of the operating system!

BATTLEZONE:

After the success with Centipede, a friend and I decided to take a look at the new BATTLEZONE cartridge. First off, for those who've been wondering, I can personally guarantee that it DOES run on BOTH the 800XL and the original 800 -- no matter what the sellers of the XEGS may tell you! This in itself is significant, for reasons I'll get to momentarily.

Battlzone banks into memory looking like a 16K cartridge: addresses $8000 through $BFFF decode into cartridge ROM. Execution begins at $B000, and IMMEDIATELY things get complicated.

Hans Breitenlohner explained to me a little about the role of location $D500 in implementing more-than-16K cartridges; basically, what seems to happen is that storing a value into $D500 affects what appears at addresses $8000-$9FFF (the RIGHT cartridge space, 400/800). Specifically, it acts like a "bank select" register. Storing $00 at $D500 results in ONE set of data in $8000-$9FFF; storing $01 at $D500 results in a totally separate set of data at those addresses. (Note: I am ASSUMING, at present, that $D500 controls the whole ball o' wax, toggling 8K blocks in and out all at once. Hans, you mentioned that addresses $D500-$D5FF are actually involved in this - that would imply that the banking segment size was much SMALLER; can you confirm or refute? Anyone else?) Initialization of BATTLEZONE consists of storing #$00 at $D500, copying 8K of data from the bank at $8000-$9FFF, to RAM at $4000-$5FF F,
then storing #$01 at $D500 and copying a second 8K to $6000-$7FFF, then stor-

ing #$02 at $D500 and performing a JMP $4000. Whew. That cartridge copies 16K of itself into RAM, and sets up a THIRD 8K for access in ROM, JUST in the INITIALIZATION routine! Skimming the code, I find that $D500 is manipulated "on the fly" during execution of the program, banking in I know not how many more 8K chunks at various times.

The thing that I find interesting about this, is that it works just as well on my original-series 800, as on my friend's 800XL. This makes the $D500 bank-switching scheme something of an "undocumented" feature all the way from the beginning of Atari computers! MAPPING THE ATARI says absolutely NOTHING about location $D500 (in fact, nothing about any address between $D40F and $D800) in the "main body," nor in Appendix 11 ("Addenda and Errata to the First Edition"),
of the "Revissed Edition." The only mention of this little marvel is made in Appendix 12, which states, in part, that it is "... unused in both XL and 400/800 models"! The implication, which I think I've just disproved, is that it didn't even EXIST until the XE series! And there's NO hint of the bank-switching capability.

(Oddly enough, I had a hint of this while trying to track down the intermittent heat failure about which I posted last week -- I noticed in the schematic for the 800 "personality board," that a "$D5xx" line comes out of the address multiplexer chip. Sounds like that might have something to do with all this, eh? There was ALSO a "D6xx" line! What might THAT one do? Any takers??)

Hope this is of interest to someone: note that my investigations are for the purpose only of understanding my machine, and educating myself and friends in that direction.

Ryan,

Well, Ben says when you put a stock 800XL next to the Super Video II XL
the difference is quite amazing. He worked hard to get the impedance matching
correct, and to take out as much noise from the video signal as possible.
Things like shadowing, and fuzziness is almost totally gone. I'm gonna
hopefully do the upgrade sometime soon, and if I remember, I'll post
the issue that it appeared in to the net. That way you can order a backissue
from Current Notes.

Or something similar.

Jeff -

Perhaps someone could compile a list of Bob's mods and submit
it to the archive? I've known about Bob for many years, but
never knew where to contact him.

I installed his "MORRAM" mod on my 800XL (it's this one chip
thing that frees up a certain page in RAM that's unused but
mapped to ROM, I think).

I'd sure like to see a list of what mods are out there and who
we can get info from!

David,

Hmm, the MORRAM modification is a new one to me! To document a complete list of Bob's works would mean having access the ALL the backissues of SLCC Journal, and compiling a database of information in them, and then xeroxing the material and keeping just the "Pounding on the 8 bits" material all in one easy to access file somewhere. I don't have all the back issues, and in fact currently I am no longer receiving the journal. I gotta renew my long distance membership to the SLCC, but I've been a little tight on money these days... having a bunch of other things I have to worry about first. If some rare bird out there wants to mail me a complete set of back issues... well... it'd still be a massive job to go through and document everything that Bob Woolley has done, compile a database, and provide reprints to people seeking this or that from the archive of things he's done. I'm also not sure what sort of copyright agreement is involved, I'd have to talk to Bob about that aspect. Certainly is an interesting idea, how many other people are interested in this?

Jeff

Bob Wooley got his hands on one & demo'ed it at the SLCC meeting. A really nice piece of hardware. He was loading digitized graphic(9) photos & they seem to come up almost as fast as a ramdisk. Far as I know, he never figured out how to use the built in speech synth, but he was pretty happy with what he did get working.

599. 4-Player-M.U.L.E. on XLs

>Jeff

Jeff --

Well, this is true. Does the SLCC have back issues of the
Journal? I'm planning on writing Bob tonight about 1200XL
mods. I'll mention this idea to him (and perhaps try to
get a cost on obtaining back issues). I'll even ask him
about the copyright issue.

Perhaps what would be ideal would be a photocopied-type book
of all this kind of stuff. Certainly a huge undertaking, but
not impossible.

Ok, I'm going to go out on a limb here and volunteer to do the
indexing at the very least. I'll go even further out on a limb
and volunteer to find out about copyrights not only from Bob,
but also from Analog and Antic.

So, Jeff, just how many issues of the SLCC do you have? Would
you be willing to photocopy the appropriate articles and mail
'em to me (I'll pay for photocopying and postage if you'd like)?

You can have 3 players on an XL by using a joystick in port 1 and
a set of paddles in port 2. You must have at least one joystick, and I
think people share it. The paddle control is pretty bad but it may be
your only option.

>half years ago!

[stuff about centipede & battlezone deleted]

quite a while back I started a cart-copying thread. Before
I lost interest, I reverse engineered my Mac65 cart. I'm
sure others know how it works, but I'll mention what I found
in case someone cares to know.

the mac65 cart has a 16K eprom & a couple of ttl parts (flip-flips,
nor gates). It uses the $D500 (cctl) line to switch banks, using
a0 & a3 to select the bank. The reason two lines are used to
select a bank is that you can disable the cart completely and use
the ram beneath it.

one idea that I haven't tried would be to tie the $D500 line
to an interrupt, and have the interrupt code switch the banks
using extended memory banks. you'd need to find the instruction
before the interrupt to figure out which bank to switch in.
you'd still need to contend with the copy-protect stuff of writing
to the cart space. I'm not sure, but those cart that use bank
switching may not make an attempt to do any other protection.

Anyone know if all the OSS supercarts using the same setup?

If you look around, you may see the 13-pin SIO connectors being used for
something else. I know it's true with the 13-pin DIN monitor plug on the
ST's, Pioneer uses them on the head unit end of their CD Changers.. Freaked
us out to see an Atari plug on the radio...

I'd imagine that there may be someone else that decided that the SIO type
of connector fit his purposes.

but... maybe not.

Is anyone out there interested in an index to hardware
mods available for the Atari series (400-XE series)?

The idea here is to make available this sort of information
all in one place. Of course, how to find this info would
also be included.

As an aside, would anyone be interested in a photocopy
compilation of hardware projects? Cost would be minimal
(ie photocopying, postage, and if necessary, copyright
royalties).

So what do you say? Anyone curious enough? I've already
begun to work on the Analog/Antic copyright issue.

O.K. Let's try this again:

o Atari 800XL w/dust cover
o 1050 disk drive
o 850 Serial/Parallel interface
o Zenith Color Monitor
o RF modulator
o Game paddles
o All Power Supplies and cables

Manuals:
O.S. Users Manual, O.S. Source Manual, Hardware w/ schematics,
850 Interface, Zenith monitor

Books:
6502 Hardware Reference, 6502 Assembly Language Programming,
"Your Atari Computer" Poole McNiff Cook, Atari Basic Programming

Software:
60 Disks many double sided including:

Microsoft Basic, Home Filing Mgr. , Deep Blue 'C', Ham Radio
stuff, AtariWriter Plus, Flight Simulator w/Manuals, Atari
Paint w/Manuals, Music Writer w/Manuals, XL Translator,Conan,
Strip Poker, Pole Position, and (Of Course) ton's of other
games.

Everything is in excellent condition and works perfectly.
Price $125 + shipping. Will consider breaking it up - make
offers.

Dave,

Sounds good to me. I have about two years or so, I think there are up to like 5 years of back issues or something. Don't know if you can get back issues or not. I might know someone who has all the backissues, who I could convince to send them to me, so I can XEROX the Bob Woolley stuff, and then mail them right back to him. Personally, I can't see how Bob Woolley would mind being immortalized further in print, so long as we're not out for profit or anything like that.

In some of articles he also prints some source code... we gonna distribute a floppy disk with this?

>Ciao, Kol
>
Kol,

Here's the problem:

On the 800, joysticks 3 and 4 are wired up to Port B of the internal 6520 PIA chip. On the XL, they removed those joysticks, and used the electrical connections from the PIA to control the internal BASIC ROM, OS ROM, seld diagnostic ROM enable, and 130XE banked memory selection. In order to turn a 800XL into an 800 compatible with MULE, you would have to install a 2nd PIA chip, containing ports C and D, move all the above 800XL signals to the new PIA chip, and rewire in the old joystick ports to PORT B. But if you do that, your upgraded 800XL wouldn't be 130XE compatible if is has extra memory, and all the other stuff like SpartaDOS, things like the OmniMON XL chip, SpartaDOS X, wouldn't work because these all fiddle with those ROM, internal BASIC, and self diagnostic control bits, and they expect to find them at their original locations. Quite a snafu hey?

David,

Just thought you should know, a while back the Midwest Atari Group, Iowa Chapter printed a little red book called "Mods, Fixes and Upgrades". Mine is dated August 1987, and is 52 pages long.
here is the TOC

The 800 Plus 256K
800 ++++ 256-512-1-2-4 MEG!!
Atari 800XE modification
Souping up the 1200XL
130XE 320K upgrade
130XE 576K upgrade
XEMEG The 1 meg 130XE
Newell 256K upgrade fix
XE audio fix
800XL keyboard fix
XM301 fix
XE console key fix
hardwired keypad
4 joystick XL/XE
1050 write enable switch
shared drives
1050 double density fix

Some of the stuff is missing important information, like the memory upgrades
some are missing schematics, even though the article refers to them!
The 800XL 256K and the 1200XL 256K upgrades are missing schematics.

FOr the guy playing mule, the article specifically says the 4 joystick
mod in the book does not work with it... sorry. They are multiplexing
the joystick inputs... and requires some handler to be loaded or something.

I thought I read in the PIA upgrade project that it would be possible somehow with it. It had to do with wiring up two more joystick ports. It also required you to boot up a translator disk.

Anyway, check into that. (I might have the file around here somewhere, tell me and I'll try to find it.)

I remember it as a magic time myself. I was dating a jockette at the time & we used to play racket ball 3 times a week, then go out for pizza, beer, & arcade games. Her younger sister, Lisa Shaules, worked a phone in customer service. When we'd hang out at her parents house on holidays Lisa would have one of the latest/greatest games/consols that she'd bring home from work. The entire family would be sitting around playing the Atari just like a TV commercial! Lisa would ocasionally bitch about handling 5200 joystick complaints & how obnoxious she be to get rid of the caller. Lisa's married now & moved to Sacramento. My office mate at work had a roommate named Sonny who worked in shipping and recieving. Sonny also used to fill in on the Alza softball team when we'd be a man short. My office mate said Sonny was in such a stae of shock when he got laid off that he said nothing for weeks, just sat home drinking & playing his 2600. After a while he asked Sonny what'd happened & found out about the layoff.
Bill Willkinson is still around, but he cut all 8-bit ties. I think Jay Minor is still around. I believe it was he who did most of Atari's & Amiga's silicon. I'm guessing it was he who Bob Wooley had speak at a SLCC meeting, but I missed that one (& just about every other meeting for that matter <g>).
Gawd that was a great time! (i.e. pre crash) Things were good & getting better. Pre Nintendo Zombies & "A Computer" meaning an IBM clone.
BTW: You didn't have anything to do with Quest Electronics did you?

Well, I'll go out on another limb and volunteer format them and put them into a PostScript file. (Or a Microsoft Works or Word file.) This way we could get some nice looking docs. (And I'm stretching to the point about everyone having access to a PostScript printer or a Mac or IBM running windows.)

Is there any interest in this sort of thing? (I would volunteer to do it in DD3 or something, but I have very little experience with that.)

Re: Learn to Print not working on 1200xl

It SHOULD work on the 1200xl! I have an old used Okimate 10 (now non-functional... grr..) and remember using the Learn To Print program...

remember... 800XLs and 600XLs have built-in BASIC!... and a translator disk shouldn't work!.. the xlator DOWN-grades the OS back to 400/800. It works on the 1200xl as well, I think... so you DON'T want the xlator :).

Try plugging in BASIC and booting the disk! That should work just fine!!!!!

613. Cart copiers

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-25 21:26:58 UTC
From: spatton@lamar.ColoState.EDU
Message-ID: <Feb25.212658.27981@yuma.ACNS.ColoState.EDU>
Source record: 107875

This is in response to the few people who contacted me regarding cartidge copying programs that I had in my disk library...(No, its not that big :))

I found four programs that were purportedly cart copiers. I could only get two of them to run... one was basic and didn't work although you can list it so if you wanted to screw with it to get it to work... well, you could I guess.

The other non-working copier gave a error 136 when Loading it from Dos 2.5

The two that I have that work (boot) are both for 800 machines with two slots. I did try getting them to work with my 1200XL and managed to slide the cart in right once and create a disk file of my BASIC cart but it did not fully execute.

Anyone wanting to play around with these can get them from me but right now I am having a hard time getting things to my internet account uncorrupted so...

Basically, my U/Ls to my account have not worked well... I have an ARCed file of both the working copies that I will send to the archive but I don't think that it is intact. I may D/L it and try it out first.

Anyone want them??? Drop me a line and I'll be happy to send 'em anywhere...

Well, yeah, at least one or two. You're right, this is a completely
not-for-profit venture. It also might make sense to upload the
index and source code material to the archive.

Ryan,

Well, that would be cool. At first I thought it would be a matter of 8 bit pride to attempt to DTP the stuff solely on an 8 bit with a Deskjet printer or something, but there just DOESN'T exist the software to draw high res diagrams and stuff for the 8 bit.. Too bad.. SOMEDAY (sigh)

> the speech synthesizer, what can I say?
>

Jeff,

My boss had a 1450xld, and wished he never had gotten it.
The built in drives did not support standard dos, so we had to
fashion a nul modem to transfer files from an older computer to
save on his- and only in DOS file format! No bootable disk would
work. It was mismanagement, not the hong kong connection that did
it in. Market research showed that there would not be enough
interest in it to produce- you see it was getting as expensive as
a "real" computer, and they decided against it. Atari was known
as the power without the price, and as we were starting to build
more and more expensive machines- we were defeating our purpose.
Market research showed that we should only build computers with
OPTIONAL hardware such as drives- as a lot of the people wanted to
begin one piece at a time, so as not to feel bad about spending so
much money all at once.

I agree with that market approach.....sq

Boerge,

There is a nice tutorial on display list code in Mapping
the Atari. I remember this much, that $70 was "leave 8 blank
display lines". The rest is a fog.....sq

Jeff,

In the original 800 design, we made provisions to provide
a good "tv" signal. This was done away with for the xl series,
and a cheaper "resistor mixer pad" was installed. Copy the 800
design, and I think you will clean up the xl-xe video noise
problems.

623. vt100 term prog help

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-26 19:08:23 UTC
From: c369b08@hawk.depaul.edu
Message-ID: <1993Feb26.190823.5490@hal.depaul.edu>
Source record: 107885

I was wondering if anyone out there can help me. I am trying to get
a vt100 emulator (preferably 80 columns) and kermit protocol that runs
correctly on my system. I have tried many different PD programs with
varying degrees of failure. My setup is as follows:
standard 130XE computer, Indus GT 5.25" drive (single, enhanced, and double
density), Atari 1030 modem, and Atari DOS 2.0, 2.5, and 2.6, DOS XL, or
MachDOS.

If anyone knows of a vt100 terminal emulator and/or kermit program
that will run on this system, I would GREATLY appreciate it.

On a side note, my M.U.L.E. disk went bad awhile ago, and I didn't
send my registration card in. If anymoune knows where I could get a copy
of M.U.L.E., send me mail. (I'm sure you M.U.L.E. fans out there can
sympathize with my plight.)

Thanks,
Aaron Zygmunt
c369@hawk.depaul.edu

624. Re: 4-Player-M.U.L.E. on XLs

Newsgroup: comp.sys.atari.8bit

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <76503@cup.portal.com>
Source record: 107886

Jeff's right about most of the mess it'd cause, but I thought I'd add:
I've run FIXXL & checked the Pokey pot pins for paddles 4-7 & you can
get them to work again. The XL ROM just copies the values from the first
2 ports into the 2nd 2. Since the Fix replaces the XL OS with the 800 OS
you may be able to get the ports back *IF* you really want to go to the
trouble. You'd have to wire 8-800 Ohm resistors to the PIA port B, tap
power supply & ground, tap GTIA to restore the triggers. I'm not sure
what replacing the pot circuitry would entail. Could be as simple as
a cap/resistor if they left some of the other stuff hooked up. Since
the Fix uses RAM under the OS, you need at least one pin of the PIA
active to disable the existing ROM. Major headaches.

I'd like to see one if it can be made all inclusive. I've missplaced my Wooley 1200XL to 800XL docs, & probably spent $10 sending out copies of Genlocking the 8-bit. A central area/one huge file would be nice.

|> Is there someone out there, who knows a trick (Hardware or
|> Patch) to play M.U.L.E. with 3 or 4 Players on XLs?

If you plug a joystick into port 1, and a paddle (actually two paddles on one cord) into port 2, you can play 3 player games. You must use the stick to move around (pass it to the player whose turn it is), but you can use the stick or paddles during auctions.

|> I dont want to buy an ATARI 800-Equipment only for this reason
|> (And no one sells a an ATARI 800-Equipment ;-), but I am tired
|> of playing M.U.L.E. vs 2 or 3 stupid Computer-Players!

If you're interested, I know of someone who's trying to sell an old 800 system.

627. Spare Parts

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-26 21:15:34 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9302262020.AA11049@smithkline.com>
Source record: 107889

Well, you can tell our newfound denizen of this newsgoup, Steve Quest, has been away awhile (hiyah, Steve!). He suggests "Tramiel may provide parts...". Hah! That's a good one! Just try asking ANYONE in Sunnyvale for support for your 8-bit! You'll get laughed outta the house.

I have several spare MMU's, I got them from Best Electronics. ATV will sell you a complete set of all the LSI XL chips for $15. I think B&C sells a few chips too. Best will sell you practically any chip you want, I even got a spar spare Freddy for my XE from him. If you own an 8-bit & do not have- AT THE MINIMUM- the catalogs from Best, ATV, B&C, & CSS- then your 8-bit will just wither on the vine & die.

And for Dave Archer, Best isn't the only place that sells keyboards, I've bought several spares from ATV. On some of these items, believe it or not, you can still actually shop around & save money. Those of you who were smart enough to subscribe to ATARI CLASSICS can still read the ads from all these places & find the stuff you need, not to mention the oddball items that pop up in AC's T'n'T column. For those unfortunates among you who don't read AC, here's the contact info for Best:

Best Electronics
2021 The Alameda Suite 290
San Jose, CA 95215 USA
408-243-6950

Brad Koda's away in England this week, I think attending some show plus he has to kick butt on the fellow who's crunching code on his new R-Time 8 compatible cartridge. The introduction of the new cart has been delayed due to a software bug that causes it to lose time. Brad also is selling that TT-Touch upgrade for the XE keyboard which has that crummy mushy feel. You put these little silicone thingies under the keycaps & it makes your XE feel like an ST keyboard, more responsive or whatever. Anyway I think he'll be back the week of March 1 or so. Also you can get 64K DRAMs really cheap now, less than $1.00 apiece typically. Those 80nS chips Steve Q. mentioned are the "expensive" ones. Again, you can get those from Best or one of the other places. I have drawers full of those things, mostly obtained in the trash from old computers they throw away around here (there are probably people in former Communist bloc countries who would commit violence to get my company's trash!). You can get 200nS 4164's from Jameco (I think they'll work), for $.95 apiece- tho I regard that price a ripoff, it should be more like .$69, but heck this is nickel-&-dime stuff. Jameco Electronics's number is: 1-800-831-4242.

There's stuff everywhere if you look. something that goes along with the territory when you own an obsolete machine is that you have to keep these catalogs around. For electronic stuff I think the minimum catalogs would be Jameco, Digi-Key & Mouser, those places are all easy to order from & give

fast delivery. And for only $2.95 you can get that monster Computer Shopper magazine that offers cutthroat prices on stuff like hard drives & floppy mechs. That mag is so cheap, I got a subscription to it (I feel sorry for the mailman, tho, the thing is bigger than a phone book).

Guys,

Hey, all this nostalgic talk about Star Raiders has been getting to me.
Okay, I dug up this Star Raiders ROM and put it into the BASIC ROM socket
of my 800XL. With the Newell 1 meg forcing me to control BASIC with a
toggle switch, throwing that switch is like plugging in the Star Raiders
cartridge. I didn't have a cartridge for it anyway.. so this seems to work
just fine.

Thing Is I don't have an documentation for this bugger... can anybody
xerox me some documentation?

Hello all,

In my search for Atari 8-bit vendors I came across Best Electronics last fall. They placed an ad in the December Atari Classics that offered a catalog of all their products for $3.67 or some silly amount like that. Hearing about how much they had to offer, I sent in a check just before Xmas break. I haven't received anything yet. Does anyone know if there is a reason for this? Is Best just really slow, or did something get screwed up along the line? They cashed my check about 5 weeks ago.

I'll second this, Kermit-65 is one of the better Kermit/Vt100 terminals
I7ve used, supports all 12pf keys, supports 300 to 9600 bd (but has trouble
beyond 2400) and has one of the best 80 col displays I've ever seen.

The current version is K65v37.arc found at the atari.archive.umich.edu, the
docs are included in a seperate file and are a little vague, but after a
little testing you'll pick it right up.

638. vt term program help?

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-27 18:19:18 UTC
From: gen4112@husky1.stmarys.ca
Message-ID: <1993Feb27.141918.1@husky1.stmarys.ca>
Source record: 107900

are there any good VT emulation term programs available on BBS's in the Main/Mass. area? I'm using one now but it isn't all that good: the screen is bright white and there's not even a key to hang-up. its a pretty simple program but it works for now, one with kermit would be good. whats it normally called so if I come across it I'll recognize it? I'm calling from Halifax, Nova Scotia(Canada) so I have to keep the phone rates down. There was a bbs in the boston area that had atari 8 bit stuff but I can't remember the number.
thanks,
Randy.

Woa there steve... I think the CPU is clocked at 1.79mHz. But,
the address is set up during the first half of the cycle, so you only
have one half a clock cycle for the RAM or ROM to put the data on the
bus for the CPU to latch it in at the end of the cycle. That means
that a 1.79mHz cpu has a 3.58mHz read/write cycle, requiring
280ns or less chips. This is a big deal on the Turbo816 stuff the AppleIIGS
users use... an 8mHz 65816 would require 62.5ns DRAMS, and that doesn't
include the idle time required by the DRAMS between read/write cycles.
At least that's what I hear over there... can we resolve this problemm?

> [...]

It is not only the 1050 drives. I had an XF551 drive do the same thing
when I moved my stuff from home to school. I took me about an hour of going
though cables and disks before I finally realized what was happening. Once
I moved the drive to the other side of the TV all was fine.

I would assume that the high-frequency / high-energy output of the
fly-back transformer was causing the interference.

641. Atari 800 question...

Newsgroup: comp.sys.atari.8bit
Date: 1993-02-28 04:03:52 UTC
From: ez007793@bullwinkle.ucdavis.edu
Message-ID: <23142@ucdavis.ucdavis.edu>
Source record: 107903

Hi all! I've been reading a while, but it is now necessary for me to ask
a hopefully basic question...
Background: I had an 800 growing up, moved to ST, now at IBM-type computer,
but I missed that 'ol 800 and for my 21st B-day, I got a "new" one from Toad.

Now, my friend and I had loads of stuff for it, so I went to get the hundreds
of disks worth of games and utilities and tried to load them...
Well, seems as though my 800 (or the 1050) doesn't want to read _most_ of the
games. Most are packed onto disks as binaries, both sides, and only 3 games
out of about 50 tested work. Also, the full disk games didn't want to go,
either. For each failed game, the computer would start to load and then get
to the point of starting the game and then the 800 would click (in most cases)
and the screen would either go black or it would system reset. It does boot
up dos. These disks do work on my friend's computer who has an 800 and a
normal 1050. I have an 800 and a Happy 1050 now but of course, I got no
docs with the system and I don't have any 8bit books anymore. Does this
sound like an 800 problem, or a disk drive problem? Secondly, could the Happy
be messing with the read functions, I'm not even sure to what density the Happy
formats its disks... I was thinking this might have been a density problem, but
what do I know, I owned one SO long ago.... I also do not know much about the
technical side of the 800. I was just a lowly game player while my friend was
the genius programmer :-).

Thanks for ANY help that any of you can give me.... I really appreciate it.
Reply here or to e-mail at 'ez007793@bullwinkle.ucdavis.edu'.
I plan on calling Toad next week, but I wanted some input.

Brian

642. 5200 ROMs

Newsgroup: comp.sys.atari.8bit

Message-ID: <TcXoZB1w165w@cybernet.cse.fau.edu>
Source record: 107904

Does anybody out there know if the 5200 cart ROMs are functionally
equivalent to the 400/800. I've heard that the 5200 is pretty much a 400
without the keyboard. Also, the 5200 cartridges are soldered directly
into the board unlike the 400/800/xl/xe cartridges which have an ic socket.

I am interested in putting together a SIO2PC system, but have been
unable to obtain a good copy of the files. The ones I have pulled
from atari.archive at umich come up bad, when I try to un-arc
them with PKXARC. Any suggestions? Possibly another source for
these files?
In particular, I get S2PCDOCS.ARC and s
S2PCBULD.arc as bad.

I had bart mail me S2PCBULD, S2PCIBM.arc, and sio2pc30.zip, uudecoded them
all, and they all worked fine except sio2pc30.zip.
the unzip process halded on the MYDOS doc file.. saying it was corrupted
and had a bad header or something. The other files uudecoded, and dearced
on the UNIX box just fine. I think you are doing something wrong with
the translation... like "Set binary" when FTPing to the site.
Use bart if you can't solve the problem.

hmmm, thats funny. I just unzipped sio2pc30.zip (using a
unix unzip), and it worked fine for me. I did notice that
one of the schematic files isn't there though. I
can re-upload it in arc format if anyone wants me to.

I just noticed a bug in sio2pc v3.03. It seems that after
running sio2pc, some programs (such as msd.exe that comes
with windows) will lock up, others will be in B&W instead
of color. Has anyone else noticed the same problem?
I saw in the article in AC that the current version is
3.07, does it have the same problem?

Todd,

Well, it came to me in like 6 parts, and I had to tack them all together into one large UUE file before decoding. Maybe I make a mistake somewhere when merging them. I just gonna manage to FTP into there sometime, like 4:00 AM ... since it's so ridiculously busy.. and get it as one piece.

Source record: 107973

Well, I had bart remail me the file, and recomposed it, and decoded it, and
de-ziped it, and it came out okay. Man, thank goodness for unix and vi, which
can handle HUGE files... easily. Wish the good old 8 bit could do that!
Omniwriter can actually handle up to about 256K of text buffer space using
expanded RAM, but man.. does editing become SLOOOWWW.
I always wondered if using the turbo816 board, with the CPU MOVE commands
and linearly addressed memory would make a high capacity text editor run
faster. Guess I'll never know.

With 1050s going for $40-60, I think you should offer $70.

652. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-01 09:15:44 UTC
From: CURRENTM@carleton.edu
Message-ID: <01GVAR286GQU91WNYT@carleton.edu>
Source record: 107956

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 20-Feb-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current, currentm@carleton.edu.

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. Hence no automatic
archiving of this FAQ List occurs, though there's usually a fairly recent copy
on the Atari Archive (see below) as the file 8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

This type of discussion: Belongs in this newsgroup:
ST/TT/Falcon comp.sys.atari.st
Portfolio comp.sys.palmtops
Lynx, 2600, 5200, 7800 rec.games.video

(In terms of compatibility the XE Game System is really an 8-bit Atari
computer, so if you ignore its marketing as a game console its discussion
belongs on comp.sys.atari.8bit.

The 5200, while externally incompatible with the 8-bit computers, is internally
very closely related. Therefore, 5200 discussion may also be relevant on
comp.sys.atari.8bit.)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the
Internet side of this discussion group. All contributions to the Info-Atari8
Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is
maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to
Info-Atari8-Request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on
Usenet's comp.sys.atari.8bit.
Note that any posting sent to Info-Atari8@naucse.cse.nau.edu will not be
cross-posted to the Usenet side. John Dunning would like this fixed, but needs
help; if you are an accomplished UNIX programmer please contact him.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning,
jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu.
The Atari Archive as a whole is maintained by Jeff Weiner,
weiner@atari.archive.umich.edu.
atari.archive.umich.edu is mirrored at the following 2 sites:
wuarchive.wustl.edu in the mirrors/archive.umich.edu/atari directory, and
src.doc.ic.ac.uk in the packages/atari/umich directory.
For downloading by FTP, the above mirror sites are functionally equivalent to
atari.archive.umich.edu.

How do I download files from the Archive?
Two methods:
1. If you have FTP access you can FTP to atari.archive.umich.edu
(141.211.165.41), login as "anonymous" and type in your e-mail address as your
password. Now type "cd atari/8bit" to reach the 8-bit directories. If this
is your first visit to the archive, be sure to download the file -read-.-me-.
Other files of general interest are 8-bit.cat, containing 1-line descriptions
of all the files available, and 8-bit.text, which contains paragraph-long
descriptions. Be sure to have file-type set to BINARY when downloading binary
files (.arc, .com, etc.)
2. Send mail to BART, the atari.archive file-server. BART's address is
atari@atari.archive.umich.edu. If you are a first-time BART user, send it a
message that says:

help
send 8bit/-read-.-me-
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
include this line:

path {your mail address here}

This allows you to tell BART exactly where to mail the files requested. This
can be useful for UUCP and other addresses that BART may not be able to figure
out otherwise.

BART automatically UUEncodes binary files before sending them to you. Other
files of general interest are 8-bit.cat, containing 1-line descriptions of the
files available, and 8-bit.text, which contains paragraph-long descriptions.

How do I upload files to the archive?
Three methods:
1. FTP to atari.archive.umich.edu (141.211.165.41), login as "anonymous", type in your e-mail address as your password, and then type "cd atari/8bit/New". You may upload files to this directory. Be sure to set file-type to BINARY if uploading a binary file (.arc, .com, etc.) Also, please upload a short .text file describing your upload so John Dunning can tell what permanent directory to move it to.
2. Send your upload by e-mail to weiner@atari.archive.umich.edu. If you're sending a binary file you must UUEncode the file first. Be sure to include a short descrption of the file so Jeff Weiner knows what directory to place it in at the archive. It is especially important to specify that your upload is for the 8-bit computers.
3. If you can neither FTP to the archive nor e-mail to Jeff Weiner, then you are welcome to post your file, UUEncoded if binary, directly to comp.sys.atari.8bit. You'll then be relying on someone else to take your posting and upload it to the archive for you. Note that long binaries should only be posted to the discussion group as a last resort.

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to retrieve any files available from anonymous FTP sites on the Internet, including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of your message says:
help

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made available to people with e-mail or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network.

Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. A newer (better?) uuencoder/decoder is contained in the file 8bit/Utilities/uue.arc. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)

835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DD/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

End of FAQ List.

653. HELP ME PLEASE!

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-01 09:21:13 UTC
From: mjr@zoo.bt.co.uk
Message-ID: <1993Mar1.092113.4382@zoo.bt.co.uk>
Source record: 107957

I have an Atari 800XL, which I haven't used for years. At work I use a Mac and a SUN SPARCstation. How can I download things for my Atari? I mean, how can I save the stuff from ftp, and then use it on my Atari. PC, MAC and SUN disks are unreadable on my Atari drive (1050 Double Density).

Now comes the part where I ask the impossible!

Would it be possible for someone to send me a 5 1/4" disk with these much needed utilities on? I thought not!

Hi,

I'd like to know who manufactures the 65816 that is used in the Tubo816
upgrade for the 8-bits. Also, where can one obtain them, MO, or otherwise.

Thanks!

No, they aren't the same. The hardware registers are in different
places on the 5200; that's the big difference. There was an article
in ANALOG a long time ago which had lots of good information on
this subject, but I don't have an exact reference.

Art,

Western Design Center makes them, and I think they are the only
place you can order them from.
The 8mHz chip costs $14.00 or so, but you have to order at minimum
$100.00 worth or stuff.
They also make 8mHz VIA chips, and an 8 bit comparator chip, and
let's see, W65c02 and 65802 chips

Can't help you with drawing high res diagrams, but I have talked to Bob Woolley about viewing scanned diagrams. If you can scan the diagram and save it in a TIFF file, I have written a program to view and print out (on an Epson or Star Gemini compatible 9-pin dot matrix) the diagram. Sadly you must use another computer to actually do the scanning... but once scanned the images can be exchanged with other 8-bit users this way.

The program (TIFFREAD) has not been released, because TIFF is such an incredibly broad format, and I can't hope to support all variants of it.

From: Rick_Michael_Cortese@cup.portal.com
Message-ID: <76685@cup.portal.com>
Source record: 107970

Gee Steve, I thought REAL engineers didn't listen to marketing types<g>. Besides, are these the same clowns that came out with the ET & Journey carts? I trust your insights into the 1450XL more then any marketing expert from Atari. 'sides, I've heard some info that I think I'm not supposed to repeat about Atari's 8-bit market that showed most of the users as more then buy a computer & stick it in the closet. Some of the stuff I can talk about are things like the surveys done by Antic. Can't recall the exact details, but something close to 100% had at least one drive & 40% had modems. IMHO: The marketing types/managers intended the computer to get through the door at cost so they could gouge on games & peripherals vs get the computers out the door & make a fair profit on what comes later. It was a strategy that worked until the clone makers started selling packages & Nintendo came out with a better game machine. The consumer really did want a package deal & after 70 years of Auto Industry 'Option' gouging probably saw through it from the begining, they just didn't have a choice for a couple of years. I <maybe I should turn the IMHO to IMO> really think it's a major mistake for any company since the '50 to employ this type of marketing. You're labeled as a "vermin company" by consumers. Atari, despite the efforts of a lot of good engineers & workers got a bum rap because of a few marketers & managers. No matter how good the engineering/software was, consumer confidence was lost. I know companies like Batteries Included directly linked their demise to Atari "Vaporware" causing them to develop/not develop certain products. It's really a shame, funny thing is the current incarnation of Atari is one of my favorites. They've cleaned up their act on vaporware, got their overhead down & still seem to be able to come out with new products. I wish them success.

663. Re: 5200 ROMs

Message-ID: <76686@cup.portal.com>
Source record: 107972

In addition to what James said, they don't have a PIA chip in the 5200.
All the joysticks are handled by the Pokey chip. The graphics hardware
is the same as an 800: ANTIC, GTIA, so you get the same quality of video.
The OS is also almost non-existant. Maybe a character set & just enough
code to start a cart.

Something I just remembered is that there is a fixed address where you
are supposed to place a 20 character string containing the name of
the game. The "OS" displays this during startup.

With the 7800, Atari threw in some encryption to prevent third party
software, so it isn't as easy to fool with those cartridges. 128 (I
think) bytes of cartridge ROM contain a checksum which is verified
at startup (this is why the Atari logo stays up for so long). If
it fails, the system BRKs. The code to check these values is
really, really convoluted.

The operating systems for the 5200 and 400/800 are different in a few
key vector addresses. More importantly, the 5200 joysticks are analog
(like the Apple][and IBM PC). Glenn, the "5200 man", from this area
(Washington, DC) converted most of the cartridges to binary load files
that work on the 400/800.

Probably the program that I have had the most luck with (and am actually
using it right now) is Kermit-65. It can be ftp'ed from the archive
and I believe the newest version is 3.7. When I first got the program (an older
version) I too had a lot of problems getting it to work, but the problem seemed
to be the different modem handlers I tried with it. I have Sparta X, but have
also run it with MYDos. I have a SX212 and the handler which has worked the
best is Bob Puff's handler, distributed with Bobterm. I have had no problems
since I tried his handler.

Gee, what is all this about problems with the XLD drives? They were essentially 1050 drives, with a few exceptions; double-sided and parallel.

The drives were designed with compatibility with the older DOS in mind, THAT is why DOS 3 had such an unusual format. THAT is why they just didn't release Atari DOS 2.0D (for the 815 drive) DOS 3 was designed to read the older single density disks AND work as a "double" density disk. (Of course, it was referred to as "enhanced" density) But DOS 3 is another discussion altogether.

A Hong Kong connection? A factory revolt? No. The reason why Atari didn't release the 1450XLD (and a host of other computers) is remember the year. 1983-1984. Atari was losing big money under Warner How about half a billion dollars? Apple was releasing the first 128k Macintosh with the 68000 processor. IBM was releasing 8088-based computers. And Atari had 8 bit 6502 computers. Bad news. The Atari 800XL was selling for around $250. An XLD would at least cost $500.

The reason was simply economical, and not going ahead with full scale XLDs probably saved Atari. THat's probably the reason that Atari did not release the 7800 back in 1984.

BAck to DOS 4. I have no idea if DOS 4 was ever to be released. I understnad that Atari bought DOS 4, but more likely as a future product if Atari should need it.

It was never released, but a few of them were distributed, promos, etc.
The two drivers were dual density, not double (this is where the term dual
comes from, because there were two drivers). The XL and XLD's were killed

> Gee Steve, I thought REAL engineers didn't listen to marketing types<g>.
> Besides, are these the same clowns that came out with the ET & Journey

No, normally I don't listen to the marketing execs, as
they were the ones that got us in trouble- refer back to my
message where I talked about a middle manager oking the use of
mylar switches in 5200 controllers, after WE said use the AT&T
princess telephone keypad and microswitches! What they said was
true, the 1450xld was too expensive to sell in the regular Atari
marketplace (Childrens Palace, Target, Toys 'r Us, etc.) I am
sorry to say this, but the Atari was always marketed as a game
machine first- filling the parents need for an educational device
as well as a game device. You see, the idea was that the kids
would want the Atari over the Apple because of the games. Atari
ran all the same programs as Apple, but included a host of color
graphic games- this is what made inital sales so big! If I could
choose a glory year for Atari, it was 1982, before Commodore 64
competition.

> carts? I trust your insights into the 1450XL more then any marketing

> games & peripherals vs get the computers out the door & make a fair
> profit on what comes later. It was a strategy that worked until the

Forgive us at Atari for trying to find a market niche, and
for wanting to make a profit! Yes, we were trying to be creative,
we gave away the computer, and gouged on the peripherals. You
see, that was to get people to buy them in the first place. I
bought my first Atari 800 (with 8k of ram) for $975. That was
JUST the computer. Each drive was $500 each, and I bought two.
They sold all they could to the hackers early- they then went
after the computerphobes, and found a way to grab them as well.
That is why the drives NEVER went down as far as the computers
themselves. Commodore did the same thing by the way.

> clone makers started selling packages & Nintendo came out with a better
> game machine. The consumer really did want a package deal & after

Whoa! Nintendo didn't come out until several years AFTER
Atari filed chapter 11, then chapter 13 bankruptcy! There was
NEVER any competition between Nintendo and Atari. You must be
thinking about Colecovision (Coleco Electronics) and Intellivision
(Mattel Electronics). They were the game competition. The
computer competition was basically Commodore, tho Coleco sold an
Adam computer at that time (with BUILT IN MASS MEMORY STORAGE!)
For those who were not around then, they bragged up their tape
drive, as it was built into the computer. Audio cassette tape
storage, about 100 baud- really *swell*.....

> 70 years of Auto Industry 'Option' gouging probably saw through it from

> still seem to be able to come out with new products. I wish them success.

Let me tell you something about "vaporware" at Atari. We
were really developing the things you often heard about. The
trouble was, the marketing people would brag it up BEFORE we got
very far, listing features WE were only speculating about. Costs
would go beyond the allowable preset, so we would have to cut out
features, and sooner or later a project would get dropped because
the same marketing people would declare that the device would not
possess significant interest to promote sales. Once again,
technology done in by politics.................sq

> code to start a cart.

Right, there is no PIA in a 5200, and the CPU was a custom
as well. The "paddle" controllers were all pot-key controlled.
Pot-key was the real name for the Pokey. Someone wanted to be
cute I guess and abbreviated it farther. For those who haven't
figured it out, the Pokey in an Atari is nothing more than a
buffed and renumbered 6532 RIOT chip. It was the 6530 I believe,
as it had some rom in it- but we never saw the unbuffed version.
Basically it was a slightly modified by programming, stock RIOT of
some kind. I know that a stock 6532 will not work, as I tried
that once on a lark. I never worked on the development of that
part of the system- it all accured before my time. The IO never
changed since the initial designs- which was good.....sq

(Pot-key stands for Potentiometer, Keyboard I/O controller. The
RIOT timers were used to generate the sounds, by changing the
oscillator speeds. Very simple design, I like it.....)

((All this Atari conversation is challenging memories I didn't
even know I still had! This is good, I guess...))

683. 1050 Strangeness

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-02 23:24:34 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9303022236.AA06192@smithkline.com>
Source record: 107995

In my early days I experienced similar problems to what Ray Wilmott describes with 1050's being exposed to monitor fields. I actually returned several 1050's to the store because I thought they were defective.

The 1050 is poorly shielded. It doesn't take much monitor radiation to mess them up. The electromagnetic field from the horizontal flyback is the culprit, in CV monitors it runs at 15.75KHz which is pretty close to the SIO which is rated at 19.2KBd but actually runs slower than that due to handshaking & propagation delays. Some monitors such as the Apple greenscreen have shields built in around the flyback, that was very thoughtful of them.

The electromagnetic field strength varies according to the monitor, & of course the individual field will vary according to an inverse-square law. Therefore you can be right on the edge of the field & the drive works; move things one inch & the drive won't boot. The fields usually aren't strong enough to damage a disk, tho it potentially can happen especially on disks stored real close to a particularly offending flyback.

To make matters worse, Atari could never make up its mind on what little shielding it provided for the 1050. Some 1050's had grounded shields, some not. Some had grounded mechanisms, some not. One thing I did to all my 1050's was to install interior grounding for both the shield AND the mech, that helped somewhat (but not much). My problems ended when I put a big piece of grounded sheet steel under my monitor. I had my monitor directly over my drives using a wooden printer stand which provided no shielding whatever, with the drives underneath.

The Mac is not affected because Macs have an interior shield, usually some metallic stuff sprayed on the inside of the plastic case, the whole interior is protected. Atari left too much of the sensitive areas of the 1050 unshielded. Incidentally, the 1050 is not only abnormally sensitive to interference from external EMF's, it also RADIATES like mad itself. I'm not exactly sure where this originates, but it seems to be in the I/O area.

Color TV's in adjacent rooms in my house were always affected by a 1050 being on, even when it was just idling.

684. Hardware Mods - Index

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-02 23:34:00 UTC
From: v462etnn@ubvmsd.cc.buffalo.edu
Message-ID: <C3AC1v.56K@acsu.buffalo.edu>
Source record: 107998

Hloe -

Well, here's an update on the hardware mod project. No
news from Analog or Antic publishers (then again, the letters
haven't come back undeliverable yet either ;-)

I've received about 7-10 responses from people interested in
this project. Anyone else out there interested?

Here's what I'm trying to do:

1. Compile an index of hardware mods/articles published in
Atari magazines and other sources.

2. (More ambitious project) Compile a photocopy book of those
same mods. Obviously, some copyright issues need to be
addressed.

It's been suggested to me that this is an excellent idea for
an Atari Classics article. So, next on the list is to contact
Ben about publishing this index in the magazine.

If you're interested and/or want to help, drop me a line!

David Anderson

Source record: 107996

OK, guys, sheesh, the "person who knows Bob Woolley personally" is me. By sheer serendipitous circumstance it turns out that the Woolley Person's employer has their main office just a few miles from where I live. Upon occasion Bob's employer ships him from California to attend whatever things they do in their main office on the East Coast. He's usually in the neighborhood for a week or so. While he's around we'll get together for an evening & do guru stuff. We've also discussed some stuff I'm hoping Bob will do for AC in a future article or 2. In case nobody noticed, Bob Wolley is listed as a Reviewer on the Staff of AC.

Yes, it's true, the Woolley Person has indeed installed an 80-meg slimline Quantum IDE drive internally in a 1200XL. I saw it with my own eyes, he ran it on my kitchen table. Very quiet. Bob uses an external switching supply to run his stuff, as installing the HD requires removal of the heatsinks & PS components on the 1200XL motherboard. However the little Quantum I think needs only a single +5V supply (no 12V req'd, I *THINK*), & it only sucks like 250mA which is practically nothing. You could run it from a stock Type I 800XL supply ("Beauty Queen") no sweat.

B U T ....

The drive was functional but not operational. Bob had to boot it from a floppy, & all it would do was read gibberish to the screen. There's as yet no interface software. IDE is 16-bit but the machine is only 8-bit so you end up throwing away half the drive's capacity.

I'd say let's wait & see what Bob does with his Little Frankenstein before anyone runs out & plunks down $250 for one of those drives.

Myself, I prefer tried-&-true hardware. Kindof essential when I depend on it to run AC, especially AC's subscriber database which worries me constantly. I've now switched to 44-meg removable media SyQuest drives, driven by a CSS Black Box/Floppy Board (with a few additions of my own). These are solid performers. Maximum reliability, short of nuclear war. If the drive dies, I got a backup mech to use while the first one is off getting repaired. The best part of that is you don't send your DATA along with the drive. And of course I have spare cartridges, so if a cart bites the dust I just slip in a my backup & go on with my business until I find time to reformat the funky one. Either SpartaDOS or a bad cable bit my 20-meg Seagate HD, which I still keep around to back up any terminal catastrophe with the SyQuests (tho if I have to use the Seagate it probably means we are having a nuclear war already).

The neat thing about the SyQuest is, sure you pay $290 for the bare mech plus $63 for the cart. But EACH CART is a WHOLE NUTHER 44-meg drive! For less than $65 each! A half dozen or less could hold every program ever written for the Atari 8-bits. Hell with this hardware I'm good for the next 10 years

at least.

From: rosborn@en.ecn.purdue.edu
Message-ID: <1993Mar3.015554.13466@en.ecn.purdue.edu>
Source record: 107999

I recently re-joined the 8-bit world and was wondering if there is
anything which allows Amiga <-> Atari exchange for files. I have easier
modem access with my Amiga and would also like to keep my software on
3.5" floppies if possible (I trust them more!). I realize this would
require a hardware device to attach my 1050 to my Amiga.
I do have a cable to connect an 8-bit piece of hardware to either
a standard serial or parallel port (don't remember which, came with the
Atari Xformer for the ST). If anyone has 1050 pin-outs I would appreciate
it if you sent them to me. I might be able to rig something up myself
that way.

Thanks

I have had an even stranger experience with the 1050 and my 130XE. It seems that neither are properly sheilded and when I placed both on top on a small metal filing cabinet, that I was using as a desktop, I was able to load and run programs for only a very short time. It appeared that the metal cabinet was reflecting the I/O from both the drive and the 130XE and it would hang the cpu with garbage.

Well if you have a 16-bit register, there would be no problem? shifting out 8
bits at a time, thereby not thowing away half the capacity.
well more like two 8 bit regs, I can't imagine that it would be too difficult.

What do you think?

Ok, I'm a little rusty on the procedure but here goes....

1) Connect the 850 interface to the 800
2) obtain a null modem cable and attach to interface and rs232 on ibm
3) from there, use a typical communications software to transport

You won't be able to use software, just data unless you obtain xformer for
the beast......

>that way.

I, too, have an Amiga and like to keep Atari files 'n' things on 3.5"
floppies (I don't necessarily "trust them more," but they give more storage
in less space).

I have transferred files between the Atari and the Amiga in at least the
following ways:

1) The ol "null modem" -- a cable that connects from the Atari's to the
Amiga's serial port, making each computer "look like a modem" from the other's
point of view. Simply run file-transfer software on both ends and away
you go; with an Atari 850 Interface Module I can blast stuff across at
9600 baud with no problem at all.

2) Run MSH on the Amiga (under 1.3, anyway; doesn't work under 2.0 but
then I guess there's CrossDOS) to write the files onto a 3.5" floppy in
MS-DOS format. Find a PC that has both a 3.5" and a 5.25" 360K-capacity
(low density) floppy drive (these are getting damned scarce) and run
UTIL to copy files from the MSDOS 3.5" floppy to a true-double-density
Atari (MyDOS) disk format. Drawbacks are that you require that speci-
fically-equipped PC, and an Atari drive capable of "true" double density
-- and UTIL is a little quirky too.

Someone will certainly mention SIO2PC, which lets a PC emulate an
Atari (810? 1050? other? what exactly DOES SIO2PC "look like" to the
Atari, anyway?) disk drive directly on the SIO bus; personally I'd LOVE
to port SIO2PC to the Amiga! I program for a living so it's probably
within my capabilities, but I'm also not "focused" enough to devote
the time and energy to actually doing it. I would fully support YOU
in doing the port, though, should that come to pass! :-)

In other blue-sky ideas, someone was working on a cable that would
connect some kind of port on the Atari ST, directly to the CARTRIDGE port
on an Atari 8-bit computer; maybe some kind of an adapter+software could

be contrived to connect the cartridge port to the Amiga somehow.

I assume you have modems but just don't have the file-transfer software for
the Atari -- the old bootstrapping problem, "how do I file-transfer my first
file-transfer utility?" :-)

The Mac, Sun (SPARC), and, of course, PC, can all write files onto 3.5":
floppies in MS-DOS format (I don't know the name of the utilities for the
Mac, but there's "mtools" for the Sun); if you have access to a PC that can
read the 3.5" floppy and write to a 5.25" floppy (which *might* have to
be of the 360K low-capacity variety), you can run UTIL (available from the
Atari archive FTP site, whose address I can never remember) on the PC to
copy files from the MS-DOS 3.5" floppy to the 5.25" floppy in "true double
density" MyDOS format. See my previous message to someone else on this
very topic!

BTW, the unmodified 1050 drive is NOT "double density" and will NOT
read the disk written by UTIL on the PC. The stock 1050 is "enhanced"
density, but you can get hardware modifications to convert it to "true"
double density.

> cost $500.

Mark,

The 6502 was not the "wrong" CPU. In fact, it was the
most popular- used by more separate computer manufacturers than
any other (in home electronics). The 65 series was used by ATari
for all their devices- the drives use the 6507 (same chip, less
features, half the addressable space, 28 pin package), as does the
2600.

IBM only chose Intel to build their PC around because
Intel was in financial difficulty, and they could get the rights
cheap. Intel chips were not the best, just the cheapest......sq

Mike,

If the drive spins, or if the drive light comes on-
chances are the cpu chip is ok. Common failure on those devices
was the RIOT- a 6532 stock item. Try swapping out the RIOT in
question, and see if it maybe took a static pulse on the SIO port.

Well, that connection will allow you to transfer files, but you will
have to run telecommunications software on both machines to do so, and
the 8 bit won't think it's a fast floppy drive like the Sio2pc interface
does.
The device isn't that hard to build from what the docs say, I think the docs
say you can have the author build it if you are having problems. He might have
changed his policy since then though. If you are worried, send
me the parts and I'll build the thing for you as long as you promise to
become a loyal Atari Classics reader (grin).
You can boot stuff from it, but copy protected software won't work, because
obviously you can't emulate the error sectors.
But with the new revision, you CAN use MyDOS and have say 16 megabyte
partitions that your Atari 8 bit sees, to stuff as many files onto as you
want. Not too shabby.

Jeff

699. Super Video Rev 2 for XL/XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-04 16:51:23 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9303041539.AA17299@smithkline.com>
Source record: 107811

OK, peoples, I been watching this half-baked banter about Super Video long enough & can't stand it any more. I was hoping to avoid this, as I regard Super Video to be Old Business. (Once I publish an idea, for me it becomes Old Business & I move onto new things.)

Jeff McWilliams is wrong when he says "...shadowing and fuzzinness is almost totally gone." There's no "almost" about it: shadowing & fuzziness ARE totally gone! Super Video 2 gives you the best possible video output your machine can possibly produce, the display is limited ONLY by the quality of your monitor.

Lord Quest, very sorry, but your advice to people to transplant the 800 output circuit into their XL is ABSURD, for the following reasons:
First, the 800 circuit is much more complex than the XL circuit. Installing it in an XL is beyond the ability of most weekend solder-jockeys.
Second, I am not all convinced the 800 circuit is optimal. I've not done an A/B side-by-side comparison of an S-V XL vs. a stock 800, but I have a great deal of confidence in Atari's engineering incompetence RE: video outputs. I got TEN DOLLARS COLD CASH that says my Super Video XL will OUTPERFORM a stock 800. Most XE owners think THEIR machines have the best video. WRONG. I HAVE done an A/B comparison of S-V Rev 2 XL vs. a stock XE, & even to the untrained eyes of obervers at WAACE, S-V Rev. 2 clearly won.
Third, Super Video is almost ridiculously simple- & dirt cheap- to do. It requires only that you ADD a few bits of wire plus a couple cheap resistors & capacitors readily available from Radio Shack. Total cost of electronic parts is like 50 cents. The most expensive part of the upgrade is the optional switch, which will set you back an additional $1.50. This is within the capability of the weekend solder-jockeys, & the parts are readily available at a price that amounts to pocket change. Anyone who would prefer the 800 circuit to something this simple had best get on back to their asylum.

Get with it, Steve. Atari's well-established tradition of video engineering incompetence is alive & well even today. Check out the CV output of the 1040 STe. It's an ATROCITY! And harder to fix than the blunders they made in the 8-bits.

There's a lot more involved in the video thing than just resistor pads. Super Video starts by cleaning up the basic monochrome signal, & preserves it by eliminating all the contaminations from the color clocking signals that enter into the circuit further downstream.

The article was published as a 2-part series in Current Notes, September & October of 1991. Interested parties should contact the present 8-Bit Editor there, Rick Reaser. He's on Compuserve: 72130.2073@compuserve.com & will be glad to furnish info on back issues.

Those of you who rely soley on nets for your info are missing the boat. My hardware hacks in CN exemplified what I expect of a hardware hacking article: thorough research, clear detailed instructions, professionally drawn schematics, & clear photos showing not only the modified circuit board but also clear screen shots showing the before-&-after affects of the mod. You MUST have print media to convey this kind of information, there's no substitute for it.

I did manage to extract from Joe Waters at CN the right to transplant my "8-Bit Alchemist" column into Atari Classics. Perhaps I should negotiate reprint rights to my articles as well???

The problem I face in this regard is as follows:
I'm Managing Editor of AC; this by itself is a full-time job.
I'm Circulation Editor of AC; this by itself is a full time job.
I put in 50 hours a week on my REAL full-time job (you know, the one that pays my bills.)
I got no time to eat, sleep or pee, much less crank out hardware hacks. If I spent my time hacking, there would be no 8-bit mag to publish them in. I'm a person blessed with a variety of talents & resources, but the one resource I DON'T have is TIME. I have this encumbrance, it's called "flesh".

Does this Video upgrade work on 1200XLs? My 1200XL with RAMBO-XL 256K upgrade and 800/800XL switchable ROM was SUPPOSED to (says Bob Woolley, who gave it to me) have better video than my old 1200XL stock's video... but... it didn't. It actually had WORSE. The color is over saturated, and that looks like hell on a simple text screen, because of artifaction. Even a GRAPHICS 9 low res screen still has a hint of red and blue on certain edges. BLEAH!

I GUESS I'd better wait until I get my next upgrade from Bob.. hey.. maybe I can convince HIM to do it for me? :)

later. thanx in advance.

>atascii to ascii conversion, and a mini-dos functions.

Interesting! I made a simple program called ZIPSPLIT in TurboBASIC XL
(for myself, mainly) that takes a "ZIPNews" file and converts it into 11K
chunks for editing in TextPro or any other word processor with 12K or
more (AtariWriter+ comes to mind...)

ZIPNews is a feature of the BBS I call (Cyberden) to access UseNet. (it
runs Waffle BBS) It ARC's the new newsfeed messages into one BIG file,
so I have to

1) translate ASCII CR/LF's to AtASCII EOF's
(can't use BobTerm's "[SHIFT]" feature, because it's an ARC file,
not
text)

2) split up the file

It's a real simple program. Not really what I'd consider "good", but it
does it's job. It's sorta cool because it shows all the status, and has
a CR/LF count that goes up as the INSTR and MOVEs work with the
originally loaded block. It tells you how much was just loaded, how much
is the total loaded bytes so far, etc. A whole bunch of useless stuff!
:)

Anyways... intriguing! (sp?!?)

at me!) :)

> Thing Is I don't have an documentation for this bugger... can anybody
> xerox me some documentation?

Well.. by not going into detail, I can explain most of it. Of course,
you'll be missing out on that AWESOME picture on the front of the manual.
I LOVE that picture! :)

anyways...

"Your orders: DESTROY ALL ZYLON STARSHIPS ON SIGHT, SHOW NO MERCY." :)
hehe

The styles of ship:

Zylon Fighter:
|o| (also known as [^A][^T][^D] in AtASCII! hehehe)
"Designed for high-speed attacks. At close range they can be
deadly."

Zylon Cruiser:
/\ (upside-down "U")
"These ships may have assigned patrol routes within a sector and
will not attack unless provoked."

Zylon Basestar:
* (the up-pointing triangle on top of a down-pointing triangle...
nevermind that... it blinks... :))
"Unlike other Zylon craft, these ships are equipped with shields
[the blinkiness] and can only be destroyed at close range. [not
close enough for me, actually. I want more dog-fighty challenge]
Use extreme caution when attacking a BASESTAR"

I won't go into the scoring and such.

Here are the key commands:

[0]-[9] Twin-Ion Engine Control (also aborts hyperwarp)
[A] Aft view
[C] Computer attack control (the cross-hairs and targeter. Also locks
photons to target (I love it!))
[F] Front view
[G] Galactic chart (the map. use the joystick to pick Hyperwarp
dest.)
[H] Hyperwarp (be sure hyper-warp target is in center of cross-hairs
or else you'll end up anywhere! (actually, there's an order to
this "chaos".. the place the target is compared to the
cross-hairs
when hyperspace appears is the off-set of where you'll be
verses where you set your destination for.. ..just try it)
[L] long range sector-scan (I'm assuming that SRII is played "in
this mode" only..? would have tosee it, I guess..)
[M] manual target selector.. (sometimes the on-board computer is
stupid and picks to target (show distance/direction/place in
the targeter) an enemy farther away than, say, one who's busy
attacking you from behind :))
[S] sheilds... obvious :)
[T] tracking computer... what automatically controls the front/aft
view when aiming for a target
(I like this:
"WARNING: This mode should be used by experienced space pilots
only. It is possible to be caught in a cross-fire in which one
enemy is in front of you and the other behind you. As they
alternately fire at you, the computer will automatically change
views on the screen (front to aft or aft to front). [no side to
side? :)] This will happen very rapidly and only experienced
STAR RAIDERS will be capable of surviving.)" (hmm..YOU are a
"Star Raider," not the enemy.. didn't realize that until now)
[P] pause.. hmm! careful of that 9 minute attract mode.. you
may come back to an empty screen with just space flying at you
(hey! just like the Windows star-field After-Dark screen saver
hahaha!).. moving the joystick ends pause

Here's the meaning of the display panel:

V:12 K:18 E:8260 T:2
-:+12 |:+10 R:+236

V - velocity
K - kills ("gotchya!'s", if you will..) (ok.. you won't :))
E - energy (out of 9999 at beginning and on refill)
T - target .. will be "C" when computer is tracking. Which enemy is
being
tracked
- - theta - horizontal offset of target
| - phi - vertical offset of target
R - range .. how far he's away.. (you can just see an enemy at about

150 I think (this is from experience))
+ means in front of ship ... figure out the rest for yourself :)

When you're in [G]alactic chart mode, you'll see a different status line:

WARP ENERGY:0120
TARGETS: 3 DC:PESCLR
STAR DATA: 45.00

Warp energy is how much energy will be used if you hyperwarp to the
selected destination.
Targets is how many enemies in that grid.
DC: means "damage control".. the color of the letters following it show
their status:
green (blue?) - fine :)
yellow - damaged
red - "where'd they go?" :)

P - photons (damaged - 1 shoots(?) destroyed - none! defenseless!)
(RAM'EM RAM'EM!.. oh no..wait..that'd be stupid :))
E - engines (damaged - I forget.. they kick out and in I think..
destroyed,
same thing but they won't go over "6" (in "V"'s, not keyboard [6]..))
S - sheilds (damaged - blink on & off.. destroyed.. you have none!)
C - computer (damaged, only tracking on screen works.. no #s.. destroyed,
neither)
L - long range scan (damaged, you get a messed up picture.. dest. no pic)
R - sub space radio (damaged, you hear when a starbase is being attacked
or destroyed.. destroyed.. you're deaf AND blind) (don't quote me on
this one.. or any of them, for that matter :))

Ok.. the thingies on the maps are:

> (a rocket-looking thing) - 1 or 2 enemies

= (three dashes) - 3 enemies
-

- (four dashes) - 4 enemies..
--
-

\|/
-+- (blob sort of "*" thing) - starbase
/|\

Starbases repair/reenergize your ship. To dock with it, get it as close
(big) as possible.. let the little ship or guy or whatever fly up to
you... you'll hear a beep.. it's all pretty simple, just don't move, and
DON'T SHOOT! :)

When in front view, little dashes and lines will appear in the targeter
("Attack Computer Display")..

the above-the-center ones mark when you're horizontally locked on
the below-the-center ones mark when you're vertically locked on
the bottom ones mark total lock-on (SHOOT NOW! you'll get him even if he
moves.. supposedly.. not 100% accurate :))

the sub-space radio updates the map and plays a "close-encounters" song
and shows on the "information" line (top of screen except when in map
mode) when a starbase is surrounded or destroyed.

Oh yeah...the [atari] or [//] ..aka "inverse" key aborts the game.

For velocity, the key vs. "V:" numbers go:

0 - 00
1 - 00 (slow!) (sorta like "impulse")
2 - 00 (slow) (sorta like "impulsive") :)
3 - 01
4 - 03
5 - 06
6 - 12
7 - 25 (average Zylon speed)
8 - 37 (can barely out run them)
9 - 43 (fastest except when starting to hyperwarp)

Remember, [START] restarts the game, [SELECT] selects a new level (ends
the game!)

You can definitely figure it all out from here! hahaha :)

ENJOY STAR RAIDERS! IT'S THE BEST GAME ANYWHERE!!!!!!!

(esp. for 1979! jeez! good job guys! (as if any of them are
listening!!!)(?))

Actually, there's a users-group/club you can contact...

they're REALLY into Atari 2600/5200/7800/Lynx... they have an ok
newsletter (I've offered to edit it for them if they want to, as I've
seen not-too-few spelling mistakes and typos, but hey... ya ever see
ANTIC-An Anthology Volume 1... HALF THE PROGRAMS DONT WORK CUZ OF TYPOS!
ugh!!!!!!!!!) anyways... they're they "Atari Video Club" and make "The
Atari Zone" newsletter...

reachable at:

A.V.C.
(c/o Dan Iacovelli)
1411 N 36th
Melrose Park IL 60160-2726

(NOT Melrose Place, thank goodness hehe)

707. Light Pen and Touch Tablet (and more software) for SALE ***

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-05 02:31:44 UTC
From: lenn@mentor.cc.purdue.edu
Message-ID: <C3E9ox.Cv1@mentor.cc.purdue.edu>
Source record: 107813

I have the following Atari 8bit stuff for sale:
Light Pen with AtariGraphics Cartridge -- Best Reasonable Offer
in great shape

Touch Tablet with Atari Artist Cartridge -- Best Reasonable Offer
lot of use but still works fine

Basic XL -- $8

SynFile+ -- $15

Print Power -- $5 (Discounts for multiple item
orders)
One on One -- $7

Kampfgruppe -- $8

Flight Sim II -- $9

Everything works fine and has original documentation.
Buyers pays UPS ground shipping.

Thanks,
Jody Lenn

From: wbdst+@pitt.edu
Message-ID: <5337@blue.cis.pitt.edu>
Source record: 107820

I know that Happy enhancements allowed disk drives to, ah, "archive"
software, but how do they work? Are they controlledrs for the drive?
Do they provide any other features, such as added densities?
What drives are they (were they) available for?
How much would one cost today?

709. Re: IDE Hard Drives in a 1200XL

In addition to this newsgroup, I also read comp.sys.tandy, and it seems that some Tandy computers require 8-bit IDE drives, and some drives have a jumper to select 16-bit or 8-bit operation.

It might be, if the printer-port drives were standardized like IDE is. As I understand it, printer-port hard drives require special driver software, and the manufacturers aren't too keen on giving out the data needed to interface one of these drives to other types of computers.

>several BBS's with ATARI programms and think you have some of them also), do
>you know any ideas? I saw there "modem" sighn new the interface, but this
>isn't usual RS232 interface, but do anybody know its protocole? So can you
>please ask anybody or at least look in manual for pin assignment and so on.

So, can somebody answer a few of these questions? Reply to me.

A while ago he traded me some things for an Atari sx212 modem, it has SIO port. Can he connect it to the 800XE? I think it would be rather hard for him to find the SIO cable but perhaps he can build it himself. Is it possible to connect it to his PC? Is it possible to connect a regular tape recorder to it? Any other info relating to this would be helpful as well.

Thanks!!!

713. Copying disks, HELP!!!!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-05 15:53:24 UTC
From: cl238405@ulkyvx.louisville.edu
Message-ID: <1993Mar5.115324.1@ulkyvx.louisville.edu>
Source record: 107825

Hi. I have long since bought an MS-DOS machine and completely given up on my Atari 800XL. But my uncle, who is a fanactical computer gamist, still uses an 800XL (an extra I gave him). He doesn't have Internet access and I do, so I volunteered to post this message for him. His Atari setup includes a 1050 disk drive, DOS 2.5, and NO fancy communications stuff like modems and software. (He also has an MS-DOS machine, Apple II, and a Commodore 64, if that's any help.) The problem: He and his friend like playing this really cool Atari game that has long since gone out of print. It is copy-protected and there is only one copy, so if it goes bad, they're in trouble. His question by now is probably pretty obvious, but I'll ask it anyway: How do you make a copy of this copy-protected disk? I remember seeing ads in old Compute! magazines for programs that claimed to do the job, but I never bought one. Niether did he. Since niether of us have a modem or fancy versions of DOS, how can he duplicate this disk? Perhaps there's a program for one of his other machines that will copy disks EXACTLY, regardless of machine format? Perhaps there's an Atari program at one of the ftp sites that I can download to an MS-DOS disk and SOMEHOW transfer to the Atari? Any suggestions at all? Is it even possible? Since I'm posting this message, I'll try to read this newsgroup every now and then for a reply, but e-mail would be appreciated. Besides, this group is actually pretty intersesting: I always wondered what the deal was with the 1450XLD -- now I know. Anyway, he and I both look forward to any help you can give us. Thanks in advance!

I bought a Happy Enhanmcement clone around six years ago for my 1050. At the time I was also looking at the original Happy chips. If I can remember correctly they made enhancements for the 800's and the 1050's. The package that I bought came with two drive controller chips which I installed myself. If you are looking for one now, good luck. They probably sell for around 30-50 dollars. I bought mine in Germany for approximately 75 dollars. Looking back I must say that it was a good purchase. The chip makes the drive high density and increases the disk speed 2-3 times as much. Also, I have been able to "archive" about 99.9% of the programs in my extensive software library. If you have anymore questions drop me a line. Later.

As far as I know the only non-HARDWARE based (i.e. it didn't require
modifying either the drive or the CPU) copy program is CHIPMUNK from ALPHA
(don't have the exact address? anybody with any ideas) but my ads aren't
current so I don't even know if they're still is business. The other
alternative is hardware-based solutions from Computer Software Services in
New York (again, I don't have the exact address on hand) but they can be a
bit more costly than CHIPMUNK (which I believe ran in the $30 to $40 range
back about 4 years ago) Also, CHIPMUNK claims to remove most copy protection
from protected programs (there were some later programs from Electronic Arts
that required specialized hardware which CSS sells) Some of the copy pro-
tection on the Atari was quite sophisticated. (anybody remember the spirodisk
concept?)

719. Re: Obtaining a 65816

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-06 22:09:50 UTC
From: root@uunet!scarrow
Message-ID: <1993Mar06.220950.789@uunet!scarrow>
Source record: 107830

I have read the FAQ, and have been a fairly avid reader of this newsgroup, but I have never heard of the Turbo-816 upgrade. I am only partially familiar with the 65816 (I heard that they used them in the Apple][GS). I have never heard of the remaining chips you mentioned.

I have the following questions:

1> What the heck is a Turbo-816, and how do I get one?
2> Is it semi-compatible with the Atari-800? (can it play Star-Raiders and Fort Appocolyps? (sp?))
3> Does the 65816 have more registers? (Or hopefully more that 256 bytes of stack?!?)
4> Do most of the instructions still execute in 1 to 3 cycles?
5> Is it possible to have access to more than 64K without bank switching?
6> Will it work on my 800, or does it require a Modern XL/XE machine?

If this critter really exists and works, info on it should probably be added to the FAQ. I would personly want to do an upgrade of that type to my machine, but never knew that it existed.

Thanks for any info.

>How much would one cost today?

As far as I can tell, you replace the drive's circuit board with the Happy Enhancement. It does all sorts of arcane things which involve reading and writing individual tracks and sectors, as well as fast reads and writes and warp speed (which is useable from a special version of DOS 2.0. I doubt it is possible from Mydos, however.). They were available for the 810 and 1050. The 1050 provided true double density in addition to its other capabilities.
I can't remeber the cost, but it was over $100. The company went out of business a while ago. You might still be able tofind a used one on the net, or perhaps find a similar device in Europe (are there other drive enhancements available?).

Hello out there!

I'm a new reader of atari.8bit. I am owner of a few Atari-
8bit- computers member and an active member of ABBUC/Germany.

On april 3rd, there will be a meeting of the TOP- Magazin, a german
PD- Disk- Mag. Atari- fans from all over Europe will come together to talk
and to change new demos and pd- soft.

The most important german distributors will be there, too.

The meeting will take place in Halle/Saale in Germany.

If you are interested, please contact me. If you are not, you can contact
me, too :-)

(I`m looking for German 8bit- Users! Please write!)

Michael

726. Classics Hacking Manual

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-08 21:51:57 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9303082031.AA10197@smithkline.com>
Source record: 107836

Well I been following this thread about collecting a booklet or whatever on good hacks for the Classic 8-bits. Since it looks like sooner or later I'll be approached about it, I'll save everyone the effort & just throw in my $.02.

I think the idea is a good one. A central compedium or whatever on hacks is much needed & will be an extremely useful appendix to current info on our machines.

I have a copy of the usergroup-produced manual that Jeff McWilliams alluded to. I suppose it is better than nothing, but I have reservations about it. AS Jeff indicated, it is an amateurish thing, with missing diagrams, some bad xeroxing, & a sprinkling throughout the text of statements like "This hasn't been tested" & "We're not sure if this works...". Call me a perfectionist or whatever, but I HATE stuff like that, a bunch of junk thrown together. I'm of the opinion that misinformation, or botched-up stuff, is worse than no info at all. Poorly conceived or poorly documented hacks are a disaster for the weekend solder-jockey, for whom a hacking project could well turn into just another way to butcher your machine. Having seen at first hand some of the butcher jobs people have done in the name of "hacking", it's no wonder the mere mention of the word turns a lot of people off.

If this project is done, it should be done RIGHT. Or else not at all.

Here are some criteria I offer to ensure the project would be woirthwhile:

1.) Some hacks have more than one version. Sufficient reserach should be done to ensure only the best or most recent versions are presented.

2.) Every single hack would have to actually be perfomed by someone & verified. Test results if applicable should be included.

3.) Every single hack should be accompanied at the minimum by a schematic diagram. Preferably something done either by a graphic artist or the output of a schematic drawing program on a hi-rex printer. All components in diagrams should be labelled using standard notation. wups... make that a "hi-rez" printer... (either a 24-pin DM or laser)

4.) Up-to-date parts sources should be found, listed, & VERIFIED. Each hack should have its own parts list in a table, complete with as many sources as possible for oddball stuff. This is REALLY TOUGH. (A good example is Cheep Talk, presented by Lee Brilliant in a 1985(?) ANALOG(?); if you can't get the SPO-256 chip it requires- which is no longer sold by Radio Shack- then the hack is worthless.)

5.) The text has to be as clear & unambiguous as possible. It has been my observation that most people just don't know how to write good instructions. A standardized format- beginning with an explanation of why you would want

to do the hack in the first place- is recommended. The quality of the editing of this compendium could make or break it.

6.) Where possible, hacks should be optimized. I.e., the thing should be done in the simplest way possible (KISS principle). Certain types of operations are quite difficult for most people- desoldering parts from double-sided boards & chopping holes in RF shields or plasic casings is where much butchery occurs. If possible, ways should be devised to minimize or eliminate mechanical machining operations. If maching operations are unavoidable, a list of the tools required & a followup in the text of how the tools are employed would be a minimum requirement. The objective in all this is to make the hack as "bullet-proof" as possible, so that the part-time hacker will have a fighting chance at success.

These are just a few of the thoughts off the top of my mind. I've had a little experience in this stuff. Since 1975 I've built over 400 pieces of electronic gear. About half from kits, the other half from scratch. I've published maybe 15 or 20 articles in electronics, including some hacks in CN. I've seen examples of HOW, & how NOT, to write instructions for electronic projects. Good manuals came from Dynaco & Heathkit. If you want to see a really AWFUL one, take a look at Newell's instructions for his 1-meg upgrade.

I myself will not have time to participate in this project (AC keeps me totally occupied).

However, if a group of 8-bitters were to get together, pool their resources, & come up with a well-knit product employing the above suggestions, I might be willing to employ the auspices of AC to produce the thing & make it available to the community. I'm not sure how that would work, but I did manage to get our magazine into print so I guess anything's possible. If the thing has sufficient substance but ends up needing a little editing, I might even find time to contribute to that myself <groan!>.

This is my gauntlet, & I've thrown it down. Anybody wants to pick it up, don't post to me personally, post to the Newsgroup.

DOUBLE, or ENHANCED density? Stock 1050's do ENHANCED, unreadble by IBM drives. An upgraded 1050 would do DOUBLE, whichis compatible with IBM drives, MORE OR LESS.. you'll need the program "UTIL.EXE" on your IBM to run it. UTIL was made so that IBMs can read Atari disks...

way cool

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.8bit

I have just managed to get my hands on 'Turbo-Link XL/XE' But the software version is only 0.96. (Mostly German). Running the ST to XL conversion selction, results in an 'available in version 1.0 message.

Does anyone out there have, or can tell me where to get, a version of the software more recent than 0.96 (It was written in 1990, so it's not all that old!)

By,

M. Reitershan Computertechnik
D-5429 Meihlen/Taunus

Any help would be great, as it means I can *finally* get my print-shop libraries (all 8 disks of them) into Print-Master + format! (With a bit of work). Not to mention the loads of other goodies I can exchange back & forth!

E-Mail replies would be best, no point wasting bandwidth.

732. Atari junk sale

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-09 06:31:34 UTC
From: ricortes@TheRat.Kludge.COM
Message-ID: <BBT5ZB1w165w@TheRat.Kludge.COM>
Source record: 107852

Hi Guys! Well I finally made the switch to another internet node. I doubt if anybody has been trying to reach me for anything other then maybe a flame, but I'm now at RICORTES@KLUDGE.COM or something like that. I'd like to thank Mike Sherwood for letting me on the node. It saves me at least $20/month. I'm not sure how quickly my post will get to the sig, or if they even will <g>. Anyway, as some of you may know, I live in the vicinity of Atari Corps, so every once & a while I come across Atari equipment. I've got a chance at buying a couple of pallets of returned Atari merchandise CHEAP. I guess Atari figured it was cheaper to sell it as scrap then have a tech fix it. The woman at the warehouse said new in box, but when I picked up a 1050 W/O said box & a 65XE in box, I found out the 65XE was just a power supply, keyboard, & plastic case with no mother board & the 1050 was obviously returned merchandise since some of the screws anchoring the PC board were missing. The drive mechanism was also kaput, but I just swapped the mechanism from another 1050 mechanism & bingo! working drive. I'm going to have to have a SERIOUS talk with that lady next time I see her. Punch line to all this: If the defects are about 1/2 due to PC boards & 1/2 due to mechanisms, I think I may be able to get a number of these drives working. They also had a lot of other junk like track balls and 820 printers, 1010 cassettes, stuff nobody wants. I told her I was on a net that still has about 200 active members interested in Atari 8-bit stuff so she said she'd sell me the whole lot for $500. I don't want to take a chance on taking a $500 hit & ending up with 20 or more drives then I could ever use, so I thought I'd put it out to the net. The drives don't come with power supplies, but I'm pretty sure I can swap boards & sell some working drives for $30 & some guaranteed not to work stuff (depending on what there are more defects in, board or mechanism, I could probably send out a hunk of hardware with either the mother board or the mechanism working) for about $15 including shipping. This seems like a fair deal since a drive belt alone goes for $6-$8. The busted drive I got obviously has a bad track Zero sensor & I think they go for $12 or $15 #$@%! Anyway, if you E-mail me a response in the next day or so, they may still be there. It's possible someone else will grab them before I get enough responses to warrant cracking open my check book. I do have the SAMS 1050 service manual, but not much else so I can offer some help with drives. My only gripe is; don't say, "save me a drive & I MAY buy it sometime next year" I can't wait that long.

The message editor didn't ask me for a group or distribution, that could
be a BAD sign. Anyway, here's hoping I got through to the right place.

734. 800XL RAM problem

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-09 14:26:08 UTC
From: enertec@netcom.com
Message-ID: <1993Mar9.142608.16664@netcom.com>
Source record: 107844

I recently raided my parents' attic, salvaged my old 800XL and
1050, and have come up with a couple of questions. Any help is greatly
appreciated.

1. My 800XL has 48K RAM, but during the self-test only the first
40 seem to be tested(only 40 blocks light up -- the first two
rows of 16 and a third half row of 8). The 40 all pass the
test (green lights). Do I need to replace a chip or something?
If so, which one and where do I get one?

2. I read a reply to a different question in which it is mentioned
that the 1050 can be converted from "enhanced" density to
double density. Can I get more information about this?

Thanks in advance,

Mike P

I may be able to explain your XL self-test "problem": BASIC on the XL can either be active or inactive (and you don't, as far as I know, have to be in BASC [sorry] BASIC, for BASIC to be active). If BASIC is inactive, you will see all 3 rowasxxx rows of RAM count up, in the self test. If BASIC is active, the count will only go through 2 and a half rows. Try this: leave your disk drive off, and boot up, while pressing OPTION 9whcihxxxx which deactivates BASIC), you should go straight to the self-test, and the memory test should show all 3 rows. Now, boot-up (again without disk drive on), and let the XL go into BASIC. Now type BYE: you should exit BASIC and go to the OS (since there's no OS, and the "Notepad" of the 400/800s has been replaced by the self-test, that's where you'll end up). Now run the memory test again: BASIC is active, even though you are not presently using it, and you should only see 2 1/2 rows of RAM tested.
Took me a bit to figure that out too...

.

Assuming I see three complete rows during the memory
test, I'll take that to mean I have 48K of RAM. So what does
it mean when I boot a commercial application program and it says,
"This program needs 48K and no cartridge to run."(I have no
cart in when this happens). Do I have bad memory or is my program
shot? I doubt that it is the latter, as I have multiple copies of
the program, and they all give me that message. If it is bad memory,
why doesn't it show up in the self-test? If you think it is a bad
chip or something, any ideas on where I can get one?

As always, much thanks in advance.

If we're still talking about the (400/800)XL, you need to hold down OPTION at boot time to disable BASIC.

I have a catalog from Alpha Systems that I received last year, so I think they are still in business. They still list Chipmunk (along with a list of the programs that it can back-up), and the price is $34.95. Their address is:
Alpha Systems, 1012 Skyland Dr., Macedonia, OH 44056
Phone ("24 hour order hotline"): (216) 668-6469. I have only bought one program from them, Magniprint (that was several years ago), and am happy with it. But I have no experience with Chipmunk. The catalog states that Chipmunk requires NO hardware modifications or special hardware.

The cartridge port on my Atari 1200XL has worn out, and I'd like to be able to use the cartridges which I have. (mainly to play games and entertain me and my roommates)

If anyone has a 600xl or 800xl machine available cheap, please let me know. I don't need anything other than the console itself. If you either have one for sale, or know where I can get one, please send e-mail to me at zalewk@rpi.edu

Thanks in advance. -- kennyz

I have a Copy of Chipmunk and have been very happy with it. What it does is actually remove the copy protection code from the program. So it has a limited set of programs it can copy. If you want to copy one that it supports that`s great otherwise its as good as using DOS to copy a disk. I did run into a small number of programs that it said it would copy but couldn`t. It comes with a substantial list of programs if anyone wants to know about a specific one send me email.

I do know that the versions of Chipmunk that I have, has a side of Specific Titles that it copies, and also a side which it attempts to copy things by the Developing Software Company. As usualy, I also have various versions of Skunk, a similar Chipmunk type program. I also think I have Chipmunk+. I also have a program which is of extreme use in/against Electronics Arts. Also amongst my archives are my Own various tools I used and also a copy of The Pirates Treasure Chest, Alpha Systems Electronic Protection I & II, and some general protection removers. Strange how its all obsolete now, seeing how all the software I use is self developed now. I also vageuly remember something entitled `BootMaster` ? You would boot this gem up, then insert the program to copy, it would boot that up, and make a sector map of the disk and then you hit a key, inserted a new disk and it wrote this disk-map, and then began to copy the disk in its own unique way.
Alas, the days of livelihood.

Jim & Ben,

With all this talk of hardware hacks on the Atari, I don't
want to be one to throw water on your fire- but all the hacks I
have produced to date have NOT involved butchery of the Atari,
they worked using existing hardware "ports" and were adapted with
software. This is not to say that I don't have a 400 sitting in
storage with a half a pound of fancy LED's and switches mounted
wherever I could find space :)

Hello again. I want to thank all of you who relpied here and e-mailed me with suggestions about my original posting of copying a copy-protected disk. The first chance I got to relay this information to my uncle was last night (Wed the 11th) and it really piqued his interest. He had never heard of Internet before and was surprised at the level of detail and informativeness of the replies and the speed at which they came. Many of you said it would be a big help if you knew what the game was, so I asked him. The game he is trying to copy is called War In Russia and it is published by SSI. It turns out that he is interested in both the potential hardware and software solutions to the problem. Several of you mentioned a chip that could be installed in the 1050 drive that might make it able to copy the disk. Where can he get it? What's it called? How much does it cost? Just about everyone mentioned Chipmunk. Unfortunatly, it was just today that I found someone list an address where it could be found (thanks Nick DiMasi!). Roger Cole listed three companies in California, B&C Computervisions, American Techna-vision, and Lotsabytes (Thanks!). He's checking into Lotsabytes for a 'back-up copy' but is also interested in B&C and ATV. Do you have addresses and phone numbers for those? What about a phone number for Lotsabytes? He was particularly interested in Archiver and Super Archiver, both mentioned by Chris Chiesa (Thanks!). He called information but was unable to find a phone number for Computer Software Services where you said these programs could be found. Do you happen to know their address and phone number? Thanks also to Craig (both of them) and to everyone else who replied. Any more info would be appeciated!

I know this has been answered a thousand times, but could someone mail me a copy of the pinouts for the 9-pin serial port on the atari 850 interface?

I want to build a modem cable from it to a standard 25 pin rs232 modem- any suggestions are appreciated.

Another question:

are there any terminal programs that will work on my Atari 800 (original) that support high baud rates like 9600/19.2k,14.4, etc? Where might I obtain such a beast?

Thanks in advance,

Matt

Message-ID: <csy0ZB4w165w@cyberden.sf.ca.us>
Source record: 107715

Re: 40K showing up on 800xl's self-test

Well, unless it IS a chip problem, it's probably internal BASIC. On my 1200xl when I go to self test w/o a BASIC cart in (no internal BASIC on 1200xl's) I get all 48 dots... but when the BASIC is in and I go to self test by typing the BASIC command "BYE", only 40 of them show.

If you get to self test thru BASIC with a BYE command, reboot the computer (one way is turn it off then back on) and hold the OPTION key for a second as you boot. (Try it w/o any drives on of course...) Then the selftest should show up right away (on the 1200xl OS you get a nifty "ATARI" written on the screen and have to hit [help] to get to the test menu).

–

If that doesnt do it... I cant help.. but it SOUNDS like this is the problem

753. Re: 800XL RAM problem

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-12 01:24:14 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <43y0ZB5w165w@cyberden.sf.ca.us>
Source record: 107716

Again... just as was explained in the message you were replying to
(re-reason that only 40k RAM worth of dots show up..), and in my reply
(last post, most likely), EVEN THO BASIC ISNT THERE (being used) it still
takes up the system's RAM.

The "48K, no carts" note when you try and boot something is due to this:

long long ago, back when the only atari computers were the 400/800 (and
probably 1200xl, too), BASIC was external.... a cartridge.. When you
have internal BASIC ON (no OPTION on boot.. see further note, as well)
it's the same as having a BASIC cart plugged in. The RAM is being used
by it..

So this old program was assuming that either-

you were using a 16 or 32K machine
or
you had a cart (such as BASIC) plugged in

Back then, the max RAM avaliable was 48k, with 16k as ROM. Nowadays,
that 16k of ROM can be used as RAM with a trick, which is why lots of
stuff works on XL/XEs ONLY. (NOT the 400/800 cuz they couldnt uses that
16k)....

Anyways ... all you need to do is boot w/ [option]
pressed to get it to run properly...

that's all to it

Now for the note.. some OS upgrades actually REVERSE the function of the
[option]-on-boot. Rather than DISABLING built-in BASIC (which isnt used
all too much I'm supposing nowadays...?), it ENABLES it,so you have to
press [option] to get INTO BASIC... this seems not the case with your
system, so you must have an original 800xl OS...

another note.. DONT HOLD OPTION DOWN FOREVER!! sheesh. You only need to
hold [option] until the initial startup is complete.. ie, hold [option]
until the drive starts spinnging... you need not hold iit ALL during a
load...

and in a self-test, just holdit until the menu pops up...

got it?

good

754. Secret Ending to 2600 Raiders of the Lost Ark?

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-12 03:06:00 UTC
From: menees@utkvx.utk.edu
Message-ID: <11MAR199322064204@utkvx.utk.edu>
Source record: 107714

I have wondered about this for years, but I just thought about posting it tonight. Does anyone know what the secret message was at the end of the 2600 version of Raiders of the Lost Ark? I finished it the normal way and it seems like I found a few hints and finished it a faster way. I know that I could finish it and get all possible points on the stack, but what I could never do was find the secret message!!! Somewhere in the hints section in the back of the cartridge manuel, it said that if you finished it a certain way you would see a special secret message. I never did, and since I don't have my 2600 or Raiders anymore (my mom sold them) I never will. Could somebody please tell me what the message was? Even a number to call somebody that wrote it would be better than nothing. I'm on a quest now! BTW I did end up buying the solutions manual for it after I solved it the normal way, and I was very disappointed that it had no mention of how to get the secret message. :-(Help me c.s.a.8 you're my only hope!
Oh yes, does anyone know if Atari ever finished their SwordQuest contest? This means all four subcontests and the Grand Championship.

Thanks,
Bill Menees

Source record: 107718

To answer your second question: 9600 bps is the fastest speed you can get with an 850. The MIO and Black Box interfaces can handle 19200, but they won't work with an 800, only an 800XL or 130XE. BobTerm is the only software I know of that supports 9600 and 19200.

Bill Marcum bmarcum@world.std.com

758. Anyone interested?

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-12 05:43:05 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <i3aa1B1w165w@cyberden.sf.ca.us>
Source record: 107720

I'm still wondering if anyone'd be interested in creating the following programs (more like graphics modes, like APAC and ColrView are)...

APAC15 - where you have the normal 3-color style Graphics 15 mode, but with 3 grey values on a swapped interlaced screen to add more lumiences to your chosen hues (no, or less, actually, dithering would have to be done to a screen..!)

80 col in text mode - this would also use probably some sort of inter-lacing trick like APAC does, but this would take 2K or so of screen memory and display it on two Graphics 0 screens with probably 2 fonts (because horizontal scroll enable screws your screen RAM pointing by widening it.. look it up in any 8-bit book.. like Mapping or De Re) One font would be the "left" characters, and the other would be the "right." I started working on this, actually. I was trying to use Fork in Action!, but gave up because I totally forgot HOW to use Fork! :(
Anyways... the #1 idea (APAC15) is easy to comprehend (I THINK) but this is less, so let me explain it.

Rather than having a big 8K worth of RAM being tied up (rather slowly, might I add, because scrolling would be moving this entire 8K worth of data!, unless you use Itay's concept, the rotating screen pointer idea, but you'll still be using up 8K of Graphics RAM!)

Anyways... split the screen up into left and right screens.

If you were to display:

"HELLO WORLD"

on this screen, the first 1K block would contain this:

"HLOWRD"

and the second would contain:
"EL OL"

when you display them together, you'd get:
(using one line for one split second of screen, and the other for another)

"H L O W R D"
" E L O L"

Now, the reason you need the font is, just as in "regular" (graphically designed) 80 column mode, you'll need 4-bit wide characters rather than the standard 8-bit wide. (max res is 320 x 192, 320 / 8 = 40 col, so 320

/ 4 = 80 col.. the pixel res of each bit of a normal text screen comes out to be ... 320!, because it's 40 col!)

ANYWays... the screen would continuously display the one 40 column graphics 0 screen with the left font (characters are drawn onto the high nybble (left half)) and the left data (ala "HLOWRD"), and swap that with the right font (characters drawn on the right side of the bytes (low nybble)) and the right data (ala "EL OL")

Soo... groovy concepts, no? ANYONE BORED ENOUGH TO MAKE THEM!?

I mean, THINK OF THE EASE OF USE AND SPEED OF THAT 80 COL handler! And think of the new types of games and such that could come out with the APAC15 mode!?

see next post!

>>> phbill@cyberden.sf.ca.us <<<

759. APAC15 mode in IRG...

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-12 05:53:06 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <8iBa1B2w165w@cyberden.sf.ca.us>
Source record: 107721

Hey...speaking of APAC15 mode...howabout this:

you know how lots of games use IRG mode 4, which is more-or-less the same as graphics mode 15 turned into text-sized chunks (just as graphics 0 text is really graphics 8 turned inoto text-sized chunks) (I love the ANTIC chip! :^])

Anyways... howabout this!?

An interrupt that swaps the screen colors (regs 708 - 711 (maybe 712!? :( )) from one palette to another (hey, how about 3 colors with 3 greys!?) and one font with another... the first font being on when the palette is "color-only", and the second font being one with grey data (ie, redraw the entire font as b/w shapes.. if you know APAC well, you know what I mean...), and this font will be on when the palette is "grey" only mode..

Hell, even >I< could try to write something like that.

(In Action!, of course... using Fork... it'll be a mess, won't it, folks!) hehehe

WELL!? I WANT FEEDBACK!

thank you

>net, or perhaps find a similar device in Europe (are there other
>drive enhancements available?).

I had a fake Happy called the 'laser' which did all the same stuff - but
a LOT cheeper. It came as a board with 2/3 chips on it & used all the happy
software....
(I cant remember much cos I was young at the time, but I guess it was a
replacement prom or FDC).
It allowed the d/d to read & write higher desities (mine could r/w a PC disk !!)
And because of this it let the disk drive recreate software protection
(Usually in the form of double sectors, dodgy CRC's or bad sectors)

Happys came with software that could cope with most types of common
protection schemes, but it also had a disk specifically for troublesome
software (like Alternate Reality...)

I think a lot of 1050 owners in the UK bought either Happy or Laser so you
should be able to find one somewhere :-)

761. Textpro 5 beyond Beta release?

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-13 01:39:00 UTC
From: tribe@ted.cs.uidaho.edu
Message-ID: <C3t0L3.LBn@moscow.uidaho.edu>
Source record: 107722

I've found two annoying "features" in the beta release of Textpro 5.0
in the atari.archive.umich.edu:/atari/8bit/Editors directory.

1) I had in my text a colon preceeded by many spaces. Textpro could find the
colon using a search spec preceeding the one or two spaces, but preceeding
the colon in the search spec by 3 or more spaces could not find the colon
in the text even though the colon WAS preceeded by 7 spaces.

2) the [e] (edge right) command causes the text to the LEFT of the [e] to
be printed starting at the extreme left side of the page, ignoring the
left margin.

So I ask: Is there still time to fix these before TP5.0 is cast in stone?
The doc in TP5.0 beta distribution saya that it'll be released in December
1992.

If someone in-the-know could give this data to Ronnie Riche or give me a
internet-able address for him I would appreciate it.

762. Archiver chip docs?

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-13 06:38:03 UTC
From: chale@darmok.uoregon.edu
Message-ID: <1nrvgb$8d1@pith.uoregon.edu>
Source record: 107724

I just fixed an old 810 I got from someone, and with it came a disk for the archiver chip in it. Unfortunately no instructions were included. Booting the disk, I then figured out how to engage the chip and copy a disk with the programs but now I can only guess as to what the other commands do, or how to use the editor.

Does anyone have any documentation to the Archiver/Editor versions 1.0 or 1.2?? I'm curious what the full ability of the archiver is, and how to use the programs.

Thanks for any info,

Curtis

Speaking of MagnaPrint (since Alpha systems is still around).. does it work well (or at ALL) with Atari xmm801 printers? I'd like to get it

I'd also really like to get my hands on some color printing software for the xmm801, but I suppose I'll eventually have to upgrade to a true Epson or something like that (yay! 80cps sucks! hehe)

766. Action! Windows 2

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-13 23:02:03 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <5THD1B3w165w@cyberden.sf.ca.us>
Source record: 107728

I've taken Action! windows 2 (v.1.0?) and upgraded it a little.. very quick hack I've added a "Pr" and "PrE" command ("PrB", ...C, ..I, etc., are just as simple to add) which, rather than using the LMAR to set left margin of the window, uses a routine that displays each byte one at a time, and when it hits the right margin of the window, it wraps back to the left of the next line. I've added cursor positioning relative to the window (sorta like prepline() was) and every window stores its own cursor pos! so if you go:

activate(1) (activates window 1 and brings it to front)
pos(0,0) (move cursor to top left of that window)
PrE("Hello world!!!!!!") (display text)
Activate(2) (activates window 2, ..etc.)
pos(10,3) (move cursor to position 10,3 of window 2)
Pr("A")
Activate(1) (back to win1)
prE("Goodbye!") (will appear at position 0,1 (first print to win 1 was at position 0,0, and an EOL was added...)
activate(1) (back tO 2)
pr("B") (will appear at pos.11,3 (first print to win 2 was at position 10,3, and it was only 1 character with no EOL))

cool...eh?

also am working on move/resize(???) gadgets and a pointer...

very neato

>
>Does anyone have any documentation to the Archiver/Editor versions 1.0 or
>1.2?? I'm curious what the full ability of the archiver is, and how to
>use the programs.

I had an Archiver for my old 810, before it broke. I do remember some things
about it, however. Compared to a Happy 810 or 1050, the Archiver loses
hands down--and no speeded up i/o or anything. My Happy 1050 would copy
much more than the Archiver could. The Archiver, however, came with some
good copying software, which is the Archiver/Editor you speak of. I think
the software program had 4 distinct sections:
1) The archiver. Simple, automated copying.
2) The editor. Average to better than average sector editor with a built
in dissassembler and stuff.
3) The track formatter or something like that. It was a screen that let
you specify special formatting. For example, you could make track 3 consist
of 20 sectors of 130 bytes each, instead of the normal 18 sectors of 128
bytes each.
4) The mapper. Lets you specifiy the sector gaps or something. Quite
hard to understand, and I remember that the manual didn't do much explaining
here.
The complexity of these sections varies from the archiver (simple) to the
mapper (totally technical). Bascially, you should just stick with the
archiver and editor. I remember that no matter how much fiddling I did with
the editor, formatter, and mapper, I wasn't able to copy things that I could
with a Happy.

Title sez it all... I will be getting an 800XL w/ 256k of RAM (so will also need a ramdisk driver) and a US Doubler.

BTW, I will be able to start working/sending my FORTH system out once I get everything together. Look forward to it... it's really cool...

770. Amiga

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-15 01:35:12 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <DLJF1B1w165w@cyberden.sf.ca.us>
Source record: 107733

I saw my friend's Amiga today for the first time in at least a year. He's added some pretty snazzy stuff to it (internal clock, OS swapping on boot.. I can do that with the TV2/3 switch on my Bob Woolley'd 1200xl).

I was looking at some of the demos, though, and MAN, they look SOOO much like the Atari Classic demos! Better, of course... higher res, faster code, etc., but the similarities astounded me.

Then again, they shouldn't, because the Amiga is more of an AC's big brother than the ST/TT is.

Pretty cool. Well.. here's a question.. lots of the screens do that grad.ing, which are done by most AC's with either a multiple DLI to change the colors, or a DLI to change the screen mode to Graphics 9 at one point of the screen..

looks like these two:

```
...
black
black
dark dark grey
dark grey
grey
light grey
light light grey
white
white
white
white
white
light light grey
...etc.
```

or just:

```
...
black
black
dark dark grey
dark grey
grey
light grey
light light grey
white
light light grey
```

lig...etc.

Now.. who thought of it FIRST!? Who's "copying" who!?

Or is it just a coincidence!? (cha-right! hehe)

Re the request for information on Archiver and Archiver 1.2

Geez. It has been ages, but I used the software, and I remember a little
about it. I remember that the program had a fairly decent disassembler that
would dissasemble the contents of a sector into 6502 assembly.
You could do all the usual stuff too, like format single tracks with bizzare
sector patterns, make bad sectors, etc.

Sorry I cant tell you more. I have the manual somehwere. I will let you know
if I come across it.

Steve: Another Atari mystery you may be able to solve <g>. I was working on a bunch of busted up drives & two of them had 2797 with pin #25 missing. At first I thought maybe someone was trying to substitute a cheaper part, but then I saw a 2793 is $20, a 2797 is $30! I don't have any WDC data books or any clue why someone would substitute parts like this. Also, can you shed any light on 1050 ROM revisions? Were there any fatal flaws in the early Eprom versions? One last QUESTion, do I only have to change the drive table in the 1st part of the ROM, at about 10 bytes from start, to get them to respond to D5=>D8 vs D1=>D4?

Bill,

Well, I really know nothing about the Amiga from first hand experience.
All I know is what I catch from the Amiga vs ST flame wars that occur
so often in comp.sys.atari.st these days. But from what I gather, the
Amiga uses a display list much like the Atari 8 bit does.

Interesting trivia and all, but well, I'd rather worry about Classic stuff
and leave the Amigas to the Amiga experts.

774. The Atari Hardware Book - Update

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-15 18:02:00 UTC
From: v462etnn@ubvmsb.cc.buffalo.edu
Message-ID: <C3xzCu.L7G@acsu.buffalo.edu>
Source record: 107736

This is the first weekly update on the _Classic Atari Hardware_ book. I've heard from about 12 people interested in such a book. So, I'm proceeding full steam ahead. Several people have expressed their interest in helping out.

The plan of attack follows:

1. I'm trying to compile all the information I can get. I've contacted to publishers of Antic and Analog at their last known address about reprinting articles. So far, I haven't heard back. I've also sent off a letter to Bob Woolley about his mods. I've gathered a few books together (see the list below) but I'm sure there's more out there.
So, here's where all you great people out there come in: look around your house and see what you've got laying around. Back issues of magazines, books, projects you've designed yourself. Contact me (via e-mail is best) so I can find out what you've got and how to get it from you.

2. When I get stuff, I'll add it to an index I've started on hardware projects (44+ so far!). This index is going to be uploaded to the archives in the near future along with information on how to get most of the stuff listed in it. (Did you know that there are 9 libraries in the country that have Analog and/or Antic?)

3. I'll ship off what I get to Andrew Diller, who has graciously volunteered to scan it and lay it out so we can desktop publish it (uniformity of fonts, etc. Also lets us re-arrange the material better than straight photocopies).

4. The book. Will be available two ways: Desktop published with schematics cleaned up/redrawn where necessary and at the archive site with schematics stored in TIFF files. You'll be able to get the book from me in print form (for minimal photocopy cost).

So, now I need your help in a big way! Check your closets, under the bed, in the attic, where-ever you stashed those back issues of Atari magazines or books. Send me an e-mail message to let me know what you've got so we'll be on our way!

I registered for version 5 back last spring, and although I talked to Ron
in December, he hadn't looked at version 5 for over a month.
I suspect the situation is probably still the same.

If you are a registered user, or just want to report these bugs,
why not call him at:

1-504-277-5336

and perhaps encourage him to finally get around to finishing and releasing
V. 5

I had this project done a few years back, and it in fact used the horizontal
fine scrolling, and used only one font. The font was designed in such a way
that all the text was legible even on a regular TV. Of course, it
flickered, and I could not look at the screen longer than about 5 minutes.

If anyone shows some interest, I can upload the mac65 assembly source for it.

The Amiga's copper lists are nearly analogous to
the 8bit's display list. Both chip sets were designed by the same
people.

780. Pot Port Schematics in 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-16 01:37:07 UTC
From: rat@csi.jpl.nasa.gov
Message-ID: <1993Mar16.013707.4564@csi.jpl.nasa.gov>
Source record: 107742

LONG INTRO :

While sitting around the other day thinking about how to control
the mash temperature in my otherwise flawless :-> beer making process,
I decided put some of that stuff they tried to teach me in college to
good use and build my own automatic temperature control system. Then
the idea hit me, "Use that old Atari 800XL sitting all alone in the
closet!" It would be perfect. Keyboard, programmable, enough memory
and speed to get real fancy with the control algorithms, built in I/O,
interrupt driven timers, disk drive, ... it's got EVERYTHING.

I pulled the thing out and hooked it up again. Even found my C
compilers (Kyan and Deep Blue). I got some 9 pin mini-jacks, soldered
on some wires, and started playing around with the controller ports.
It looked like the best way to get temperature data into the machine
would be to use the pot ports and let the OS do the decoding. Once
every 1/60 sec would be plenty fast and 228 levels would be enough.
Besides, I wanted to save 2 or 3 of the PIA (joystick) lines for outputs.

ON TO THE REAL QUESTION :

While playing around with the pot input ports, I discovered that they
seem to measure resistance, not voltage. (Kind of makes sense.) However,
although they were linear with resistance across the +5v to pot line
(from 5 kOhm to 550 kOhm), if you tied the pot input to ground with a
different resistor, you get a different value. My guess is that the
input circuitry is a Wheatstone bridge and a voltage comparator. I
looked at the schematics in the back of the hardware manual, but all they
show is a single inline resistor to the antic chip.

Does anybody know the equivalent input circuitry for the pot ports.
I doubt that any temperature sensor I can afford will match the resistive
input range of the standard pot port without me building an "impedance"
matching circuit.

HELP !!!!!

David,

While I can't help you with the innards of the 800XL Analog inputs, I can tell you that Digikey sells a variety of Thermistors, with both negative and positive coefficients, where the resistance at 25 degrees celsius ranges from 20 ohms to 150K. The Atarilab basic kit has a thermistor in it, along with a cartridge that measures and will record temperature at given intervals for you. It also has formulas and programs for calibrating the Thermistor in the kit, which would apply equally well to your project. Digikey's Thermistors range in price from 84 cents apiece to about three dollars, well within the range of even the stingiest beer brewer!

Au contraire mon frere! Right here on page 40 of _Your Atari
Comes Alive_ is a "thermometer" circuit. The design is fairly
sensitive or insensitive (depends on use of 2N2222).

Send me your snailmail address, I'll dash off a photocopy to you.

783. ATARI standard serial

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-16 04:53:45 UTC
From: reeder@reed.edu
Message-ID: <1993Mar16.045345.10498@reed.edu>
Source record: 107745

Is "Standard ATARI 8bit serial" compatible with RS-232C?
A friend needs to hook up an Atari XMM 801 Dot-Matrix Graphics Printer.

There are two parts to the question. First, are the signals
electronically compatible with RS-232C levels? Second are the line
identities. I have the pinout from the manual; Data In, Signal
Ground, and Data Out lines are pretty obvious. Is Command the handshaking
line from computer to printer? Is Ready the handshaking line from printer
to computer?

Thanks in advance for any help you can give! Replies by e-mail would
be nice, but I will read the group.

784. Help: Connecting 8bit to PC monitor

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-16 09:06:31 UTC
From: wijdeven@es.ele.tue.nl
Message-ID: <7655@tuegate.tue.nl>
Source record: 107748

Until a few months back I thought the 8bit scene was dead and then I found
this Newsgroup.
I digged up my old 800XL and connected it to a small TV (I never had a real
monitor). But then I was shocked by the bad result of what the TV was showing.
It was all fuzzy and snowing and I couldn't get it any better.
Later I turned on my PC monitor and then the following thing came to my mind:

Is it possible to connect a 600/800 XL to a hercules/CGA/EGA/VGA monitor?

Has anyone tried this before? Or is it impossible?
Could somebody answer these questions or do you have the specifications of
the atari monitor bus, so I can try to figure it by myself.

Thanks.

>Also amongst my archives are my Own various tools I used and also a copy
>of The Pirates Treasure Chest, Alpha Systems Electronic Protection I & II,
>and some general protection removers. Strange how its all obsolete now,
>seeing how all the software I use is self developed now. I also vageuly
>remember something entitled `BootMaster` ? You would boot this gem up,
>then insert the program to copy, it would boot that up, and make a
>sector map of the disk and then you hit a key, inserted a new disk
>and it wrote this disk-map, and then began to copy the disk in its own
>unique way.
> Alas, the days of livelihood.

What is the program against Electronic Arts? I have the animation program
(can't remember the name right now) original disk, and a Newell modified
OS, which causes the program to barf during boot and tell me to remove the
custom OS (no way!). I've tried to figure out the copy protection; made
countless pages of printouts, went over and over the boot process with
various disassemblers, but to no avail - whoever programmed the copy
protection for EA, they were good! Lots of reading in sectors, ORA'ing
them with more sectors, to produce further boot code and/or the AE title
graphics. A bloody mess. Do you have any experience with poking around
like that?

Jos,

Until Recently 8 bitters all over have been searching in vain for just such
a modification: something that will allow us to connect those popular,
CHEAP CGA or monochrome TTL monitors to our 8 bits. Steve Quest says the
circuit is deceptively simple, so hopefully we'll have something on this in the
near future.

789. Pot Port Schematics in 800XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-16 16:46:35 UTC
From: ricortes@TheRat.Kludge.COM
Message-ID: <cgki1B1w165w@TheRat.Kludge.COM>
Source record: 107657

The pots are just a little more detailed then that. The just have a capacitor that charges after the resistor & the POKEY chip determines how long it takes for the pin to reach a logic 1. *IF* you don't go to big with a capacitor & your thermistor has to low of a resistance, just add a small value cap between the POT pin & ground. I think the puppy radio shack sells is in about the right range. I got about +- 1 degree C accuracy with it if I remember correctly. Ended up with one of my really verbose (23k) uploads on how to use the POTs for sensors & switch 120VAC with that Motorola 3010 <#?> chip & triac.

Hey all. I am new to this group, but you may have read my earlier post to alt.games.classics. I am looking for information about Epyx Inc, in particular:
1) If the have a e-mail address, and if so what is it :)
2) What thier snail mail address is.
3) A phone number I could get a hold of them at.

The reason for all this is I am looking for the source code for a great Atari 800 game called Crush Crumble and Chomp. I was hoping to get Epyx permision to do a freeware version for the IBM and maybe other platforms (Mac, Apple GS, Amiga have all been suggested.) If anyone has a copy of the DISK version, and is willing to either email me or print and send me a copy of the source code , please reply :) All replys will be answered, and any help will be appreciated :)

Here's a good one for everyone who wanted a 1090XL. I was looking through some issues of the DAL-ACE (Dallas Atari Computer Enthusiasts) when I came across this:

Give Your Atari More Guts With the XL-Expander

The possibilities of the XL-Expander are endless:

* Modem or modem interface
* Printer interface with buffer upgradeable to 64K
* RGB Interface
* Tape interface
* Disk controller
* Voice synthesizer and recognizer
* Eprom programmer
* Burglar alarm controller
* Telephone answerer
* Robot controller
* Co-processor for CPM and other functions
* Extended RAM
* Selectable custom operating systems
* Triple cartidge board.

(by Crystal Computer Products)

Anyway, this was in March 1985. I don't think there was such a beastie (there's a crude outline drawing).

Gee, wouldn't it be nice.

I have finally decided to sell my Atari 8-bit system,
it includes the following: (this is an updated list)

Hardware - 1050 Disk Drive with US Doubler $60
1020 color pen plotter/printer $10

Accessories - 5 joysticks $3 each
1 set of paddles $5
1 ICD printer cable $5
1 ICD modem cable $5

Software on disk - SpartaDOS 3.2d $10
Bank Street Music Writer $5
The Converter version 1.51 $5
Paper Clip $10
Print Power $10
The Print Shop $15
RAMbrandt version 2.0 $10

Games on disk - Alternate Reality - The City $10
Alternate Reality - The Dungeon $10
Artic Antics $10
Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jawbreaker $5
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Silicon Dreams $5
Trail Blazer $10

Books - Basic Atari BASIC $7
Mapping the Atari, revised version (includes XL stuff) $10

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: May, July, Aug/1985
May*, Dec*/1987
Apr, Dec*/1988
* these issues include the disk

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

As you might have suspected phbill, I have written a TIFF viewer program
called (drumroll....) TIFFREAD. I haven't ever released it to BBSes or
pay services or the archives here...whenever I have given it to someone
they end up coming up with a flavor of TIFF that it can't read. TIFF is
so general it can store B&W, halftone, greyscale, full color, LZW-encoded,
FAX Group 3 and 4, and JPEG pictures. My prog can only handle a small
subset of these: it can view (and print out on an Epson-compatible 9-pin)
monochrome (1 or 4 bits per pixel) compressed or uncompressed TIFFs. If
anyone has some they would like me to try, e-mail them to one of the
addresses below (uuencode it first) and I'll get back to you.

From: jjmcwill@mtu.edu
Message-ID: <1993Mar17.150430.2395@mtu.edu>
Source record: 107660

one of the problems I see with making thermometers for your 8 bit with
Thermistors or Transistors is packaging. If you're going to immerse this
in a liquid, like beer, you don't want to the bare wires showing, because
they're gonna corrode and break, as well as cause a short across the two
leads. My thought was to find an epoxy that is a fairly good heat conductor,
and somehow make a mold in which the thermistor and wires are laid and then
the epoxy poured and allowed to harden. Perhaps the 8 bit Alchemist, being
a chemist by trade, can give us some ideas on some sort of coating agent
that would be resistant to heat (say, boiling water), yet be heat conductive
but not electrically conductive. Geeze, come to think of it, I think B&C
Computervisions bought up a bunch of ATARILAB stuff, including extra temperature
probes. They babies are all ready to go, and work pretty well last time I
fooled with them. Why not save yourself a lot of trouble and just order a
couple?

Source record: 107661

I spent a summer working at a local college doing computer interfacing on Macs (a nasty word in this newsgroup). Anyway, one of our major projects involved thermistors. We spent about a week experimenting with different configurations and still could not build anything comparably sensitive and versatile as production units. I tested one from the Atari Lab kit at the time and found it to have nearly as good resolution as the ones we ordered. I'd have to agree that B&C might be the easiest way to go.

800. Help me fix my 1050!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-17 20:50:37 UTC
From: rosborn@en.ecn.purdue.edu
Message-ID: <1993Mar17.205037.9049@en.ecn.purdue.edu>
Source record: 107662

Well, I finally got my 1050 and it dies 3 days later! Here's what it did/does. When I first got the drive I had problems with it formatting disks incorrectly. When I would format a disk it would step the head 39 times then it would start the second 39 steps. On this second pass it would 'skip' about 10 tracks by stepping the motor really quickly. The drive never seemed to have problems reading any disks. Then the other day I started to boot a DOS disk and all I heard was three beeps. The drive wasn't stepping the head at all. I tried to boot again and the same thing happened. Eventually the drive came to it's present state of not being recognized by the computer at all. When I turn the drive on it spins as it normally would but doesn't step the head. It then continues to spin the hub for 3 seconds, stop for three seconds, spin the hub for three seconds, stop for 3 seconds, etc. Has anyone else had this problem or know what is wrong? Thanks a lot!

>or something like that (yay! 80cps sucks! hehe)

PicPrint 6.0 will work with it...color too! Here is some info about it:
PicPrint 6.0 by MKD Software works only on Atari XL/XE
PicPrint is a program designed to print your compressed,
uncompressed, Fun with Art, and Paint pictures on any Epson type
printer. It even supports oddballs such as Atari XMM-801 and Canon
thermal printer.
The main feature of this program is that if you have an Epson
JX-80, Star NX-1000r or compatible color printer, you can print your
pic's in full color.
If you use SDX, the drive letter will be used (A, B, C, etc.) and the
program will use the SDX default drive. I have PicPrint on a
720K 3.5 inch drive with many, many pic files. That is the best way to
do it if you have SDX. If you don't have SDX, then get it!
PicPrint will display up to 60 files They can be mixed file types-
PicPrint can tell what kind of file you have whatever the name is.
Below is a list of other files it loads and prints:
MovieMaker, Aladdin, AtariGraphics, Visualizer, Magic Painter,and force
any Gr.8 Load
Commands available:
Flip........Flips pic- useful for making T-Shirt iron ons.
Print.......Prints the pic. If you hold OPTION down while
pressing P it will make twice as many print passes on the paper. If
you hold START while pressing P, ANTIC DMA will be turned off to speed
up printing.

Menu........Takes you back to the File menu.
View........Lets you see what's under the text window until
you hit a key- then the text window returns.
Save........Saves the pic in picture in standard
Uncompressed format. This is useful for converting the pic for use
with other programs such as DesignLab or Philip Price's DLI program.
Black/White.removes the color from the screen- useful for
printing B&W on a color printer. The pic automatically changes to B&W
if you didn't select a color printer.
1-4 color...press 1 then + or - to change color 1, same for
all colors 1-4. Hit esc to exit color change

Dli.....This will load the four .P? files from Philip
Price's program. The DLI's won't show on the screen, but they will
print on paper.
Color Reg...Puts the values of the color registers on the
screen (and pic if you print it).
Gr.....Changes to and from Graphics 8 monochrome mode.
Neg.....Toggles white on black or black on white on
screen and on the paper. Works only in Gr.8 mode.
Res.....Restores colors if you messed them up. Use in Gr.15 mode.
There are a few other files on the disk- the CONVERT.COM file is
an excellent conversion program from ABBUC that will convert pics to
and from Graphics 8, ST PI3, and IBM monochrome format.
PAINTR.COM is Philip Price's DLI program. Option toggles pic on
/ off, Select changes current color, Start saves DLI's. Esc then
select turns brush mode on/off. The program is joystick controlled.
Works with AtariDOS, SuperDOS, SpartaDOS-X (if you USE BANKED)
Sorry, Sparta versions 2.x and 3.x won't work- They use the RAM
under the OS that PicPrint also uses. (see below)
It hasn't been tested with other DOS's, but most should work.
PicPrint WILL WORK with AtariDOS D8: RAMdisk and SuperDOS D5:
RAMdisk and any and all SDX RAMdisks.
The program is written in Compiled Turbo-BASIC which DOES work with SDX.
The 2.x and 3.x Sparta versions couldn't load T-BASIC because of RAM
usage.
Philip Price's program is in the Public Domain.
Picprint is Copyright 1991 by MKD Systems. I paid $17 for it from:

Bill (and anyone else),

Actually the High-Tech team is no longer together (to my knowledge). Instead, they are putting out a magazine called 'Mega Magazine' or 'Megazine' for short. 'Frankenstine' is the editor and I am pretty much his US contact. (I have no intrest in actually selling anything, but I help distribute and/or supply information). The last time that I talked to him, he said that he was a member of a BBS that was experimenting with USENET (or UUCP). He mentioned trying to send me e-mail but I never received it, so I don't know if their connection is very sound yet. I do not know his Internet address yet either.

Since I doubt he wants his home address given out, I will post the address of Mega Magazine if you like.

-Adam Conover.

Date Entered: 03-17-93 20:06

I have an old Atari 600XL that I dug out of my closet. I only have
the console, a bunch of cartridges and the cassette recorder. can
this unit be hooked up to a disk drive? I'd like to get one to play
all the old classics, and even some of the not so well known ones.
Something simple to pass the time, I guess. As I understand, the
600XL only has 16K RAM, so I would I would need more memory. Can
anyone out there give me the name of any retailer that sells old Atari
stuff in toronto, or, if anyone has a disk drive they'd like to sell,
please let me know. Also, what are the going prices for these items
(disk drive, memory)? Any help would be appreciated.
Brian Lasko

806. What killed my 8-bits?

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-18 04:04:54 UTC
From: ortega@cactus.org
Message-ID: <1993Mar18.040454.1153@cactus.org>
Source record: 107668

I was putting together a videotape for a friend of mine and
I decided to add a couple of quick screens of video titling.

I dug my old 800XL out of the closet and plugged it in.
It went directly to the test mode and but would reset to
the beginning instead of running the tests. It did this
a few times at power-up and then stopped doing even this.

I dug the second one out of the closet and it didn't even
get as far as the first.

I swear that at least one of them was functioning when I put
them away.

What could have killed them?

>Anyways.. I have a copy of Jeff's ILBM read, too, which views "IFF"s...
>dunno about "TIFF"s tho..
>
>
TIFF are the standard file format for a scanned image- in the MAC & IBM
land. They are very big files- but also have a very high resolution.
The version of the Hack Manual which will include TIFF's will be
(probally) a PageMaker document for viewing on the MAC/Windows platform
There will be other versions of the file for 8-bit direct viewing, but
this wont be as easy-obviously- you coulden't load in a 2meg file into
your 130XE. The 8-bit version will be split up, but many people out
there have the necessary harware (an IBM w/ windows or Mac) to read
the big file- and it will be alot prettier and easier to read!

?!?!?!?!

If you have an Atari 8-bit, the XMM801 is a direct connect to the
Atari SIO port. If you have the SMM804 (ST version) then you need
something like the Atari XEP80 that has a parallel port.

If you want to connect a serial printer to an Atari 8-bit (why?)
then you need something like the Atari 850 interface or the P:R:
Connection. Those peripherals have serial ports.

Source record: 107671

Well, it might be possible to, but it is very impractical to even
try to connect an Atari to a TTL monitor.

One, Ataris use a composite video output. TTL monitors do not
allow analog input. There's your answer.

Actually, if you want a better output, don't use the RF interface.
Get a monitor calbe that allows direct video input.

I use a 19" TV/monitor on my 800XL, and I get excellent video.

If you really have to have a monochrome output, then find an old
Apple II monitor, or an NEC, Amdek, or any monitor that accepts a
composite video input. via an RCA jack. You can even use an old
Apple Monitor III (or /// for you hard core Appleistas)

Earlier today I was showing off some of the more musical demos on my 8-bit to an IBM-user friend over the phone (he was busy messing with MODs... BTW! WHERE DOES ONE GET A MOD PLAYER FOR THE ATARI CLASSICS!? I HEARD THERE WERE AT LEAST TWO MADE! thank you)..

Anyways.. my VCR started tripping out (I was also at the moment busy video-taping some of the stuff from the demos). Ok..great, my VCR is going screwy again (it had done it before months ago). THEN, I started booting a disk, and it would load...stop for a few seconds... load more...etc. "Funny.." I thot. (being the humorous sort)..

THEN, I started to SMELL something.. "Oh great, now something in here is overheating! Damn!"... but wait.. it wasn't either of my two 1050s, nor my 1200xl, nor my TV, nor my VCR.. (all of which were on, but not very warm). Then, I looked on my right where I had my XMM801 printer and SX212 sitting. (they were on a stool... wicker is the only way I can describe it.. I know it's not, but it's of the same, wood-like stuff.. (sorry.. VERY tired.. probably not making ANY sense!)..)

ANYWAYS... I look a little closer, trying to find the source of this plasticy and wretched smell... and "MY GOD!" .. my XMM801 was on fire!!!!

Well.. not quite.. but SMOKE WAS COMING OUT OF IT!! (just a little, but enough to scare me to death!)... Funny thing tho, it was on the LEFT, nowhere close to the power-switch..

and the even STRANGER thing...

IT
WASN'T
EVEN
>ON!<

Soo... is my XMM801 going to kill me, or is this a common occurance!? (I've had it since 86? 87?) (maybe even earlier.. got it before my 1st 1050 I think..)

thanx in advance

815. ColorView viewing.. just for fun

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-18 07:16:56 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <XeJL1B1w165w@cyberden.sf.ca.us>
Source record: 107678

I made this file mainly for a friend of mine who I want to make a
ColorView viewer on his IBM. He'll most likely use C, but since I don't
know it, I can't write true sourcecode. Anyways, here's the little
"explanation for non-ColorView and non-Atari users on how ColorView
works"

(btw Jeff, is the MODE called "ColorView", and just the program
"ColrView", or are both called "ColrView"...)
-->8---snip--------8<-------------
"The general way of viewing ColorView files."
By Bill Kendrick, NBS 1993.

ColorView files:
ColorView mode is a 4096 color mode generated on the Atari Classic
line
of computers. It was created by Jeff Potter in a program called
"ColrView"
which is used in conjunction wit a GIF viewer called "APACView" (which
originally used a different, 256 color screen mode created by him as
well).
It is done by viewing three 16 color screens "simultaneously." These 16
color screens are in 80 x 192 resolution (not exactly high for today's
standards), and are simply part of the Atari's built-in graphics modes.
This 80 x 192 x 16 mode supports 16 shades of a specified color. This
has come in handy with ColorView, because by using three screens, one
being red, the second green, and the third blue, the Atari simulates 4096
true colors. (Another great advantage to ColorView modes was what it was
originally made for: viewing GIF files. GIF files store their palettes'
colors as red/green/blue values, so a program that converts GIFs into
Color-
View files only needs to know how to read the "RGB" palette and
uncompress
the image.)
ColorView files are really made of three files. (Actually, this is
really just the standard created by the inventor of ColorView, Jeff
Potter.)
The three files all have the same filename (8 characters), and have
extenders of ".R", ".G", and ".B" (for "red", "green", and "blue.")
Now that you know how ColorViews are viewed and stored, all you need to
know is how to read in the intensity values from each file. (These will
be 0 to 15 (16 shades of each color), so you have a total of 12-bits of
color on the screen, so if you're using a graphics mode on your system
that
can't handle that much, you'll have to just drop some of the lower bits.
(The number of bits of color of just one of the screens alone is 2^4=16,

so
a whole ColorView image uses (2^4)x(2^4)x(2^4)=4096, three sets of 4
bits=12!
The closest one can get in an 8-bit color mode (which is more or less
"standard VGA") would be (2^8)=256 colors! Converting a 4096 color value
to a 256 color value would mean dropping some bits. One way someone can
overcome this is to use dithering by drawing the actual red, green, and
blue
pixels onto the screen! (not just drawing a pixel with the blended color)
In this case, you're only using three sets of 16-colors which is only 48,
so
the palette size is greatly reduced, but the image quality is lower. One
of
the reasons I mentioned this is because compared to a normal (320 x 200 x
256)
VGA screen, ColorView (80 x 192 x 4096) has pixels 4 times as wide.
Alright, now the format of the single files... Each file is
composed
of an uncompressed 80 x 192 x 16 image, so each line is 40 bytes wide
(16 colors takes only 4 bits, or 1/2 a byte, so each byte represents >2<
pixels). The actual byte size of the file is 40 x 192 = 7680 bytes.
Let's look at it binarily:

76543210 <- bit positions. The decimal values derived from these are
really just 2^position, so the if only the leftmost bit was
on,
the decimal value of that byte would be 128. If the
rightmost
bit only was on, it'd be 1. If both the left and right were
on,
it'd be 129, if all were on, it'd be 255, and if all were
off,
it'd be 0!
10000000 <- 128
00000001 <- 1
10000001 <- 129
11111111 <- 255
00000000 <- 0

Now, remember, each byte represents >2< pixels, each having a value
(representing brightness) of 0 to 15. The leftmost (high) 4 bits are the
left pixel, and the rightmost (low) 4 bits are the right pixel.

11111111 <- 255
1111 <- left (these 4, being high, represent 240)
1111 <- right (these 4, being low, represent 15)

11001001 <-
1100 <- left (these 4, being high, represent 192 (128 + 64))
1001 <- right (these 4, being low, represent 9 (8 + 1))

Well, we've just found out that the highest 4 bits are WAY too high.
Fortunately, all we need to do is divide the value by 16 to get the
brightness value (which will be 0-15)!!!
Simple. Now, how does one go about splitting a byte up into two high/low
values? Just use "binary AND" (what represents it all depends on what
language you're using).
"AND" the byte with "240" (all left bits on) to get the left bits all
alone.
"AND" the byte with "15" (all right bits on) to get the right bits all
alone.

Simple example:

Open red file for read
Open green file for read
Open blue file for read
Set up screen (320 x 200 x 256 or more colors prefered)
Set up palette
Set X,Y coordinates to (0,0)

Repeat:

Get next from red file

Binary AND the red value with 240
Divide it by 16
Set the color to that intensity of red
Plot at X,Y

Binary AND the red value with 15
Set the color to that intensity of red
Plot at X+(one-80-column-pixel),Y

Get next byte from green file

Binary AND the green value with 240
Divide it by 16
Set the color to that intensity of green
Plot at X,Y

Binary AND the green value with 15
Set the color to that intensity of green
Plot at X+(one-80-column-pixel),Y

Get next byte from blue file

Binary AND the blue value with 240
Divide it by 16
Set the color to that intensity of blue
Plot at X,Y

Binary AND the blue value with 15
Set the color to that intensity of blue
Plot at X+(one-80-column-pixel),Y

```
Increase X by two 80-column pixels (which would be "8" VGA pixels)

If X is past the right edge of the screen Then:
Set X to 0
Increase Y by 1
End-If

Until you've read 7680 bytes
---

The end. Need any help? Contact Phbill.

(Phbill@Cyberden.SF.CA.US)

------------------------------------------------------------------------
PS- damn this place's 80 column "editor" isn't really 80 column!

Hello,
assume someone has poured a glass of hot milk into his 65XE.
This might wouldn't happen to you, but I know someone who
did it. Now his problem is that a part of the RAM isn't sane
anymore. A page or two of RAM around $600 apparently got
damaged by the milk flood. Poking around this part of memory
doesn't work anymore i.e. a PEEK would provide random
values.
Does anybody know which RAM chip usually keeps page 6 in
case of a 65XE?
What else could be wrong with this spoiled computer?

Wait a minute. I though I saw you say something about the Atari 1010's (cassette ("program") recorders) using the same power-in as the 1050's (and at least the 1200XL as well, because MINE uses the same power as these two 1050's I've got).

Anyways... funny. I didn't know 1010's used the same power-in. (Never really bothered to look, tho). My 1010 came with a plug with the power-adapter built onto it, rather than the power-adapter elsewhere.

Like this:

```
my 1010: --------O= <-prongs to go into 110/120
^ ^
| |_ power adapter
cord to 1010
```

```
my 1050: -------O----= <-prongs...
^ ^ ^
| | |_ cord to wall
cord to 1050 |
|_ power adapter
```

Strange. Did they make two styles of these adpaters or something?

oohh.. now that I think about it, (both my 1010 and the 1050 plugs that go INTO the machines are the same (dunno what it's called tho)) I plugged my 1050 power into my 1010 once and it worked.. didn't dare leave it in after I found out (about 5 seconds later :))

hmmmmmmmm...

so theoretically I could connect my 1200xl with the 1010 plug...
hmmm

less floor space being taken by adapters and feet of cord!

I like it! I like it! :)

821. Graphics 9 Viewer

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-19 00:48:03 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <s3Vm1B5w165w@cyberden.sf.ca.us>
Source record: 107684

I started work on a little QuickBASIC program on the (bleah!) IBMs at
school called "Graphics 9 Viewer" which ...views Atari 8-bit graphics 9
screens in VGA!

Wow!

It's actually pretty simple.
OTHER than the fact that I don't understand at ALL QuickBASIC's
idea of the "GET" command! UGH! So.. I dunno if it DOES
work, but theoretically it SHOULD...

here's what I do:

```
open file
x=0 y=0
for loop=1 to 7680
get byte
left=byte and 240
left=left/16
right=byte and 15
color left+16 (the VGA palette's 16 default greys are from 16-31)
line (x,y)-(x+3,y) (I hate that Line command! ugh!)
x=x+4
color right+16
line (x,y)-(x+3,y)
x=x+4
if x=320 then x=0:y=y+1
next loop
ta-da!
```

wow

now all I need is knowledge on how to >>>READ<<< bytes from a file!

ARGH

823. CC65: How to create your own routines / Modify the c.olb

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-19 04:48:09 UTC
From: clisowsk@Nimitz.mcs.kent.edu
Message-ID: <1993Mar19.044809.9610@mcs.kent.edu>
Source record: 107685

How does one go about createing/adding their own routines into CC65.
I'de like information on recreating/modifying `c.olb`, as well as being
able to create my own Routines to be included as `*.obj` files.
The perspective custom routines would be written in either CC65 itself,
but a few of them would need to be written in 6502 Code, using Mac65.
I have many numerous routines already written in Mac65 that I'de like
to access via CC65. I'de also like to have them written in purely 6502
as to ensure optimization; Although I could re-write it in C, but it wouldnt
be a pretty site.

Perhaps I'm just too used to GCC on Unix or Mac65 on the 8bit.

The rs232 that comes out of an 850 interface is genuine rs232. The 19
some odd pin coming out of the back of your computer is not, and it
has the command line for some specialized handshaking . See the Atari
users manual (the big one). I do not think that the Ready line is used. I
may be wrong, though.

Someone kill me if I am wrong, but doesnt the XL/XE use a memory lay out such that each chip stores a different bit of every memory address??

BTW, the symptoms do not mean that it is without doubt your memory. There are several other failures that could cause the described behavior.

I'm not sure about QuickBasic, but earlier versions of IBM Basic were similar to Microsoft Basic for CP/M. In that Basic, you could get a byte from a file with INPUT$(X,#Y); X=how many bytes you want to get at one time, and Y=the file number.

Source record: 107692

Nothing really to do w/ the book, but.. hey Jeff, have you played around with ColorView Squash? I just got it yesterday and it's pretty awesome. But.. found some problems:

1) ARC didn't come with Docs! NOT A GOOD THING!
2) BASIC programs had no BAS extenders.. first I tried from DOS, then from TBXL, then finally remembered something about it being in BASIC, so I stuck that dusty old beasty in.
(Is CVSquash or CVSView (aka CSQUASH and CSVIEW) going to ever be ported to full ML any time? (not saying I don't love having it in BASIC.. now I can "steal" the code! hehhe.. for games and such, ya see... maybe even a (yeah right) paint program...?)
(Btw: Jeff, did you ever put your SOURCE out anywhere? If I remember, CVSView and the ColorView mode were made from scratch. Neato)
3) When a file wasn't found, it died ("ERROR 170 AT LINE 4000") :(
4) Viewer does NOT recognize ".RGB" files... when they're LOCKED!!! If you have a disk full of ".RGB"s on drive 1 (and they're all locked), and you tell it to look at drive [1], it says "no RGB" files...whats the deal here? Was it some sort of sub-directory check? (maybe it assumes that some directories may have ".RGB" as extensions? hmm)

Well... I'm looking forward to later versions of CVSquash! Really great?

And hey Jeff, did ILBM read ever support ColorView. Are you ever going to support a ColorViewSquashed-format SAVE feature!? :) :) :)

ALSO, have you got 320 x 192 x 8 (CV8 mode) working yet, or is that a dead deal?

Boy.. maybe I should write you more often! :)

Later Jeff... billl

To everyone (else).. get ColorView squash. Very nice. You'll save SOOO much space on your disks!

good job!

It's possessed by 1050-Gremlins. It must be exorcised.

Actually.. I dunno. I'd recommend B&C or BEST for repair. I got my
1050's belt replaced for a way to expensive price (I think), and I had to
travel WAY too far to get it done.

The good thing about it tho was I got AtariWriter+ (nice spell-checker)
and my SX212 (and a copy of SXExpress! for a damned whopping $10! ugh!)

And now I'm here.
Aren't you all glad..?

Look into "print-star." (it was a program I saw demoed at the ONLY computer-meeting I've ever been to). It prints in 2 or 3 (maybe 2 or 4) columns on the page. It requires that you "print" the text to a file, then load Print Star and it'll take each of your word-processor's outputted pages of text and align them correctly in columns. It's really nice. Not sure if it support TINY tiny text, in which you can PROBABLY fit 4 or 6 (4 or 8?) pages of text by making columns AND rows (by using the printer's superscript font).

I beleive you can set it up for whatever printer you're using. If not, it'll be Epson compatible (they all are :) .. mainly because everyone has Epson/compatible printers.)

Here is the scoop: It fails to format discs properly, sometimes will not read
any disc, and if I write to a disc with the Indus that was Rana drive (my
other) formatted, then the Rana can not read it any longer. I have tried
adjusting the step motor along with checking with and messing with RPM.
Nothing has been succesfull so far. Does anyone out here have any suggestions?
I would much appreciate it. Thank you!

Jeff,

I think I did specify that MONOCHROME TTL was
"deceptively" simple. CGA is complex, not so complex if you come
right off the GTIA chip, but if you take a composite signal, and
separate out the components, you need colorburst oscillators,
3.58Mhz crystals, etc. etc.

I am kinda blowing through the messages here, some have
scrolled off since I last logged in. I fear my previous
excitement towards the Atari is beginning to fade. Primarily I
engineer computers using clone IBM compatable motherboards-
nothing remotely close to the ATari. I only use my Atari these
days for applications projects where I don't want or can't risk
taking even something as inexpensive as an XT- such as around
stage productions and etc.

I hate to say this guys, but my previous zeal is gone- I
am currently building a hack for my compatable (built from an old
printer card with all the chips ripped off). If this keeps up, I
may never get to doing anything again with the Atari's. It was
around 1988 when I last used the Atari for anything substantial,
and it is very hard for me to go back to it. I want to relive the
past, but somehow I don't want to relive the past with an Atari.
Does this make any sense? Let me try to figure myself out.....sq

(I thought I wanted this, but now that it is served before me, I
am not hungry anymore. This doesn't make sense, does it?)

> 1050 I think..)

Bill,

The primary in the power transformer is probably what is
burning. This happens when the enamel starts to decompose, and
the windings short together. What will happen now, is it will run
hotter and hotter, and the heat will turn the remaining enamel to
carbon- a conductor, which will cause more shorting and more
heating.

Replace the transformer- just get close in size and
voltage. Go overspec on voltage if you must. Make sure the
current capacity is at least close tho..............sq

(and size- mounting holes are an important factor to consider...)

What about single density Atari disks? Are they readable on IBM's?
Everything I had with my Atari said it did double density, but I assume
that it was really only enhanced, since it was 130 blocks per disk.
What sort of hardware would I have to get to read any of my 800XL disks
on an IBM?

130 blocks? Sounds like you were using DOS 3. The programs to read Atari disks on an IBM use either Mydos or Spartados format.

>What sort of hardware would I have to get to read any of my 800XL disks
>on an IBM?

An RS232 interface and null-modem cable, or maybe the SIO2PC interface.

> How does one go about createing/adding their own routines into CC65.
>I'de like information on recreating/modifying `c.olb`, as well as being
>able to create my own Routines to be included as `*.obj` files.

The C.OLB file is managed by the LIBR65 program. It allows you to add or
replace *.OBJ files or build a new .OLB file. *.OBJ files are created by
the RA65 program. These two programs are part of the CC65 archives.

>The perspective custom routines would be written in either CC65 itself,
>but a few of them would need to be written in 6502 Code, using Mac65.

You won't be able to use MAC/65 code directly. RA65 is much simpler
(no macros) and has a different syntax for high-byte and low-byte operators,
see the RA65 documentation from the archive.

Hi, I just got some working 8-bit equpt, I need some stuff:

I have an 800XL with an ICD Rambo(?) 256k ram expansion. I also have a US Doubler 1050 (which right now isn't writing. Could this be OSS Dos's fault?) I need to know either where I can get the ramdisk drivers that will work with OSS Dos XL or else how to get Sparta Dos with ramdisk drivers.

I guess I could write the drivers... but I don't know the Rambo.

Next, I'd like a (preferably proven and fast) way to transfer files between the mac and the atari.

third, and potentially an alternative to the second, I may need a way to use a _fast_ modem with the atari.

I have been able to look at my old Forth source code, and everything seems in order. Once I get these problems taken care of, I will be able to release a binary of Forth with its tools loaded so's you can take a look.

Last, sorry abt the incomplete message; this is its replacement.

853. For sale

Source record: 107615

I've got a pile of Atari 8-bit stuff that needs to find a good home, or at least somebody that will use it. Everything's in good working order, except as noted; most stuff comes with boxes, manuals etc.

I'd prefer to sell the whole works, rather than part it out, but no reasonable offer will be refused.

Atari 130XE
Atari 800, 48K
Atari XF551
Atari 850
2 Indus GT's
Atari 810, mechanism works, electronics flaky
ICD Printer Interface
Magnavox 12" color monitor
SDX cartridge

Mapping the Atari
(original?) Atari OS internals manuals

Also, the obligatory collection of misc cartridges, Star Raiders, Centipedes, Defender, Sub commander, etc, and a pile of disks, PD software etc.

I've no real idea what any of this stuff is worth any more, as I haven't been tracking the prices lately. Make me an offer!

Please respond via e-mail; JRD@Stony-brook.SCRC.Symbolics.COM.

Hmm...well.. what if you had a directory with a meg worth of stuff in it,
but only 1/2 meg of space? would it still work? does it handle it by
adjusting the VTOC (like MyDOS does)???

I KNOW it wouldn't work (without a lot of damned trouble!) on the IBM by
doing it manually
(aka:
makedir bob
copy carl*.* bob
delete bob*.*
deldir bob

(hehe.. at least my versions of the commands make a little more
sense than the MSDOS ones?)

858. ColorView <-> GIF

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-22 02:49:38 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <FPLs1B5w165w@cyberden.sf.ca.us>
Source record: 107620

Hmm.. I don't particularly have time at the moment to do this project (esp. on top of: school, girlfriend, ScotchDOS), so I'm wondering-

anyone out there "good enough" to make a GIF -> ColorView and ColorView -> GIF
conversion program(s?)??? I'd REALLY like to see one. I'm sure a GIF -> CV would run HELLA fast, compared to doing it straighout with APACView and making 3 files... and a CV->GIF would be a nice thing to have methinx. (Like my viewer idea I gave my friend, it doesn't particularly need to emulate 4096 colors straight, it could simply use 48 colors, like ColorView really does... then rather than spinning/interlacing the screen, it could just (gasp) dither...)

Perhaps even a ColorSquashView <-> GIF.. that'd be even BETTER!
:)

Bill Kendrick Novato, California New Breed Software

860. Bad Sectors

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-22 11:35:06 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1993Mar22.113506.9394@cs.nott.ac.uk>
Source record: 107623

Does anybody out there know if there is any way of creating bad sectors on a disk using a standard 1050? A friend of mine says he has a program that is supposed to work on an 810, but to use it on a 1050 you have to stick some sticky-tape onto the disk and hold it down while the motor is spinning, can't do the drive much good can it? Besides he tried it and it didn't work. Does anybody know how this program works on the 810?

I know that it is possible to make bad sectors with a Happy Enhancement, but I would realy like to know if it is possible with a standard 1050 as well.

Could you please email me with any replies, I'm going home for 5 weeks tommorow so I won't be able to read this newsgroup during that time :-(

Thanks in advance

The following Atari system is for sale:
800 xl computer
1050 disk drive
850 interface
830 modem
Commodore 1720 color monitor - excellent picture.
Wico joysticks (3)
A lot of software- AtariWriter and Atari+ word processor, about 60 games on
disk, several manuals, some documentation manuals on misc. items.
Would like to sell the entire system as a package.
If interested email me. Everything is in very good working condition--no
problems with anything except the joysticks that are only in fair cond.
Would like $240..

;-)
I do not own an 810, so I can't say anything about this.
I do have a 1050 with a Happy Enhancement.
It is possible to write special types of bad sectors with a 'normal' unmodified
1050 (I did it handling the AXIS stuff).
Okay, here is how it works :
Load a program that has the ability to write sectors (empty) and test (read)
sectors.
Put in the disk on which the bad sector should be placed.
(The following has to be trained a bit)
Write the sector XXX (the 'bad' sector) and simultaneously press the disk into
the floppy drive so that you hear the disk whetting (??; in German: schleifen).
Don't press it that much that the disk stops spinning. The write sector
routine has to produce an error (It has to stop writing to the disk).
Then read the sector (test it out). If a normal read-sector-routine produces
a read error you will'be at the end of your journey.
Don't start producing hundreds of bad sectors now. Your floppy disk will
thank you.

There are some problems with this method :
- you can only produce two types of bad sectors with it. Some programs will
ask for other types.
- some write-sector-routines try to write this sector more than one time.
Make sure that a routine does not write to the disk AFTER pressing the
disk.
- you may have to do this several times.
But it worked...
...not with a floppy speeder !!!

865. MEGA DEALS ON CLEARANCE STOCK

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-22 18:39:46 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Mar22.183946.13871@aber.ac.uk>
Source record: 107622

***** MEGA DEALS *****

Call me crazy if you want, but I have the following ex-stock items for sale at give away prices! All this stuff is boxed/sealed where applicable. All these prices INCLUDE shipping to the US!

BALLBLAZER on ROM cartridge. Brand new boxed/sealed. I have 7 of these available at the silly price of just $10 each, including shipping to the US! UK price: 4pounds.

POLE POSITION on ROM cartridge. Brand new boxed/sealed. I have 6 of these available at the stupid price of just $10 each, including shipping to the US! UK price: 4pounds.

**** SUPER DEAL **** Buy BALLBLAZER and POLE POSITION together for the silly price of just $15 the pair, including shipping to the US! UK price:7pounds.

ATARI MACRO ASSEMBLER. Brand new, boxed/sealed. You get a disk and 2 manuals. I have 12 of these to clear at just $12 each, including shipping to the US! (The boxes are big and heavy folks!). UK price: 6pounds.

DIGI-STUDIO packages 1 and 1.5. These are the old packages of the digi-Studio digitized sounds and music system. These were sold before I released the new updated and complete package last year. The original packages 1 and 1.5 will get you a keyboard player (to play music using the keyboard with digitized sounds), a tune player to play tunes in digitized sounds, a sample editor to play around with digitized sounds, and a utility to play music in your own programs. You'll also get LOADS of sound samples and tune files to play. You'll get 2 DS disks and 2 typeset booklet style manuals. This software used to sell for $20, but you can buy it now for just $5 the set, including shipping to the US! UK price:2pounds. AN AMAZING DEAL FOLKS!

EASY PROGRAMMING FOR THE ATARI MICROS book. This highly regarded British book is full of useful information on all aspects of the Atari, and computing in general. It is still published in the UK and usually sells for 6pounds, but I have 7 brand new copies to clear for just $7 each, including shipping to the US (books are heavy and cost lots to mail folks!). UK price: 2.15pounds.

THE 600XL PROGRAM BOOK. Another British book. This one is full of type-in programs for all Atari 8-bit micros. I have 6 brand new copies of this book to clear for just $6 each, including shipping to the US. UK price: 2pounds.

ORDERING
This is simple! I accept cash in US$. Simply send the cash with your name and address, and what you wish to order to:

I think you are right. I wonder if the RAM problem is related to the memory
management controller (FREDDIE?). Yes, it is doubtfull that a single
spoiled RAM chip would cause a failure around a single memory page.
Thank you for the hint.

868. 400 problems

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-22 21:30:03 UTC
From: ladd@iftccu.ca.boeing.com
Message-ID: <15290002@iftccu.ca.boeing.com>
Source record: 107636

This past weekend, I tried to resusitate an old 400 that I picked up at a garage sale. I'm trying top get it working so my son can play some cartridge based games that I have.

Problem: Machine powers up, but the monitor screen is a solid gold/amber color. Keyboard input or cartridge insertion has no effect. I took it apart 2 or 3 times, cleaned the circuit boards, pressed all of the chips firmly into their sockets, etc., but no avail. Anyone out there have an idea what kind of problem I might be dealing with? I'd appreciate any and all input/suggestions. Thanks, Bob

869. Re: CC65: How to create your own routines / Modify the c.olb

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-22 21:30:38 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <1olb5uINNrva@usenet.INS.CWRU.Edu>
Source record: 107630

In a previous article, tribe@ted.cs.uidaho.edu (Duane Tribe) says:
>The C.OLB file is managed by the LIBR65 program. It allows you to add or
>replace *.OBJ files or build a new .OLB file. *.OBJ files are created by
>the RA65 program. These two programs are part of the CC65 archives.
>
>You won't be able to use MAC/65 code directly. RA65 is much simpler
>(no macros) and has a different syntax for high-byte and low-byte operators,
>see the RA65 documentation from the archive.

Okay, I have everything from the CC65 package, cc65,ra65,link65,libr65 etc.
So if I wanted to create some new `function` which uses 6502 machine language
then I'de have to code them in RA65 format, and then run them through RA65
to produce the proper *.obj files to be used later?
I have the Lib_Source, and to reproduce the c.olb is this what I would have
to do: CC65 <all *.c filenames>, RA65 <all *.m65 filenames>, and then use
LIBR65 <on all the *.obj filenames, except for RUNTIMEE.OBJ>
I hope I have everything down pat now. I took another look at the libsrc
and the CC65 package, this time alot more extensively than before, and I
do beleive I'm getting the gigst of this. I would like to contribute more
to this CC65 package; hell this might as well be a GNU project as far as
I'M concerned -- I'm all for this public development.

Thanks,

From: eab@msc.edu
Message-ID: <1993Mar23.030510.10600@uc.msc.edu>
Source record: 107632

I've got several atari 6502 machines. A few 400s, a few 800xl.
I've got an 850 interface and a few 1050 disk drives.

What I'd like to be able to do is get a hard disk hooked up
to use with one (or more???) of these computers.

Does anyone have plans for how to go about this using ide, mfm, rll,
or other commodity low-cost drives?

any other suggestions for what I should do with all this stuff
that I never use (but that I remember fondly having a lot of fun
with, learning a lot of cool programming tricks when I was only
10,11, etc.. years old)?????

>very readatext for such small print. Are there any such programs for
>800/xl/xe computers?

I just start by sending the codes for condensed elite, superscript,
and around 10-14 216ths of an inch lines. Then each line is something
like 136 characters wide, and a page is around 180 lines long.

I usually use it for small-page applications, such as cassette and CD
labels.

I know an ST mouse can be used as a trakball-- I use one for Missile
Command in trakball mode. Only the left button works, though. I have
heard that the range isn't quite right, but I haven't had any
problems.
(I also tried it with a simple mouse handler from the archive. Worked
fine.)

A ST mouse hooks right up with no modification. An Amiga mouse has to be
modified though, but its simple to do. (I lost the text file that describes
how to do it.)

I tried my ST mouse out with the onl program I have that supports it,
Missle Command, and it works great! (Makes the game a little too easy
though)

BTW, to have the right mouse button work, all you have to do is solder a
wire from the trigger pin on port 2 (I can't remember the pin number) to
pin 9 on port 1 (Its unused.)

Keep in mind that the gentleman mentioned the latest being v031993, that's only
4 days ago. So you might pick some good information in it.

I've always thought business is business; if you have a buyer and a seller,
why not? Japan can buy anything if someone wants to sell to them. But I'll
be picking up a copy just to see what Japan might be trying to do.

There's a copy somewhere around here, but unfortunately, I want to keep it.
It's one of the reasons why the 8-bit still kicks around once in a while...
In addition to Star Raiders...

>> Scraper Caper by Big Five Software

I don't think that Scraper Caper was ever released; there was some talk
about it in the magazines, but I probably would have found it had it been
released :-).

buzy@midway.uchicago.edu has crossposted a message regarding Japanese bus. practices to many (mostly inappropriate) newsgroups. At the moment, he/she cannot recieve mail, but when he can, I provide the following hack to send to buzy@midway.uchicago.edu.

This program automatically counts the number of commas in your newsgroups: line, adds one and uses this number as the number of messages to send to you. Before you huff in anger, consider two things: 1) the number of messages sent to you is roughly* equal to the number of inappropriate crosspostings you have made, and 2) the files sent to you could easily have been several megs apiece. In the future, please determine whether the newsgroup you target is (much more than) remotely connected topic-wise. You might also read the news-group in question in order to rule out sending due to either a) having no connection whatsoever with the topic you want to discuss (I repeat: discuss) or b) having already run the topic into the ground. Note that it may take extensive searching to determine how long ago a topic has been run into the ground, and apparently eons for you to decide if that topic is connected. I strongly suggest you take this time, and more if necessary.

* algorithm for determining whether message has already been sent to you has not yet been implemented. (oops...)

Norton just renames the directory... Rendir.com, found on the SpartaDos
tools disk will do the same thing... rename the directory... this operation
does not use up additional space on your hard disk or mio...

NOTE: Rendir.com only works with SpartaDos 3.2d and above....

885. Re: IBM Utilities

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-24 04:16:52 UTC
From: ricortes@TheRat.Kludge.COM
Message-ID: <T3ew1B1w165w@TheRat.Kludge.COM>
Source record: 107648

A LONG time back I mentioned I had a program that could read true IBM disk on a US Doubler 1050. Since I didn't have a stock 1050 & there were some excellent utilities for double density drives already, I asked on several boards like CI$ if anybody would be interested in trying it out for me on a stock 1050.
DEFINE Response="0"
The only place where anybody was mildly interested was here (thanks guys!). Anyway, after fixing all those busted 1050s & reading some of the current messages, I sorted through my pile of disks. I've done a number of lame-O things since then, like manage to reformat my clone's hard disk with all my 'C source code for that end, but as I recall, it was trivial. Just using the Absread()/Abswrite() functions in the library. What I did was read the file to be transfered into a buffer, then wrote it out in 128 byte chunks to sequential sectors on an IBM disk. I used the first sector to pass file name and length to the Atari end. Problem was I could read it on a US drive it defaulted to 18 sectors/track, but I didn't know if a stock 1050 would see double density & think 26 sectors/track or stay at 18 (like my US). Now I know 26 sectors/track. What happens is you have the 1050 read sectors 1-9, then request sectors 27-35 to get the 1050 to move to the next track. Punch line is: If somebody really wants me to do it, I will break out my compiler & give it another shot. The max file size the thing can handle would be 40 tracks at 9 sectors/track, 128 bytes/sector or about 40K. The only thing I ask is for someone with an Action! cart & a stock 1050 to double check it before I waste a month of weekends on it. I shudder at the

possibility that I used the only stock 1050 in the free world that returns the first 128 bytes of a 512 byte sector. BTW: It makes sense that all 1050s 'should be able to do this since an overfilled sector or short sector with data in it is a standard copy protection scheme. 810s are still out of luck. The Code:

```
Byte Array Sec(128)
PROC DINV=$E453()
RETURN
PROC ReadyDCB()
BYTE POINTER Bptr
CARD Snum=778,Dbuff=772,Ssec,Esec
BYTE DEVOP=770,DEVNUM=769,DFLAG=766
DEVNUM=1 ;DRIVE D1:
DEVOP='R ;READ OPERATION
Print("Enter starting sector number?")
Ssec=InputC()
PrintE("Enter ending sector")
Print("or 0 to quit?")
Esec=InputC()
IF Esec=0 then RETURN FI
Dbuff=Sec
Dflag=1
FOR Snum=Ssec to Esec
DO
Dinv()
for Bptr=Sec to Sec+127
DO
Bptr^==XOR $FF
Put(Bptr^)
OD
OD
Dflag=0
RETURN
```

What you should get when reading sector #1 is 4 garbage characters followed by something like "IBM 3.3" for the DOS version. As long as you keep bumping the sector number by 26 each time you want to move to another track i.e. [1-9, 27-35, 53-61,...], you should be able to pick off all 40 tracks, but you'll only see the first 128 bytes of the 512 byte sectors. A disk with mostly text on it would be great to test.

Hallo 8 Bit Fans,

i dont know which language to use here in this area, thats why I try to
recover my last remains of english...

I am knew in this area and I would like to communicate with other
Atari 8 Bit Users all around the world

Hope I will get an answer ;-)))

No, the VGA monitor is another animal entirely. It wants R,G,B (which the
Atari doesn't produce, and it can't be retrieved by wiring into your 8-bit),
and it runs at a >30kHz horizontal rate (the Atari is around the 525-line
standard 15.75kHz).

I've recently obtained a bunch of new and unopened 7800 games. I am
selling them for $4 each and will pay for shipping if you buy 5 or more.

here they are:

CHOPLIFTER
DONKEY KONG JR
XEVIOUS
ASTEROIDS
BALL BLAZER
FOOD FIGHT
CENTIPEDE
KARATEKA
POLE POSITION 2
GALAGA
HAT TRICK

e-mail me or call (312)644-4251, please don't post because my news is about
2 weeks behind.

890. CV to TTL Video

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-24 16:41:15 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9303241544.AA23079@smithkline.com>
Source record: 107651

Mark Newton-John recommends forgetting about using a TTL monitor & just pick up "...an Apple II, or NEC, or Amdek, or any monitor that accepts composite video input." I certainly won't argue against that advice, it is altogether correct.
The problem is, WHERE do you get these old CV monitors? Unless you know someone who wants to sell one, or you are lucky enough to live near some surplus electronics place, you're stuck. I'm using Apple, Heath/Zenith, & modified DEC Rainbow/VT-220 monitors in my systems, but what happens in a few years when these old CV monitors give up the ghost? At some point in the future, all of us who are today using CV monitors will face this problem.

It IS possible to build a hardware converter that will strip out the sync signals from CV, demodulate the CV to produce a clear Intensity signal, & output the 3 signals in the standard 9-pin 5V-TTL MDA/CGA format. Several articles were published in electronics magazines over the past couple years on this subject, tho none of them produced exactly all the signals we need. At one time I was looking into combining several of these circuits to do the job, it looked do-able. I abandoned the project to work on AC.

Bob Woolley has been tinkering with a scheme that takes video signals from the GTIA/4050 buffer, does a simple sync-stripping function (*one TTL gate chip)& outputs the TTL video from there. The problem is that you only get 2 bits' worth of intensity information, & I think it's only in mono. Mono doesn't bother me, but 2 bits is unacceptable, you need at least 3 of the 4 available video intensity bits. (The 4th bit is only used in certain graphics modes, I think like GRAPHICS 8 or whatever.) I have a feeling this is probably the same TTL video scheme Steve Quest had in mind (I hope he was intending to include the 3rd bit). I also have a problem with this approach because I don't think it will be easy for the weekend solder-jockey to do. Bob Woolley's mods seem to end up with a lot of spaghetti wiring on the motherboard make me nervous.

Bob Woolley HAS published a direct TTL output from the XEP-80. I was looking at that myself, he beat me to it. I was worried buffers would be required on the output signals to prevent blowing the NS455 in the XEP-80, but Bob did it with 3 or 4 direct connections to the XEP-80 board & no buffers & it seems to work.

Unfortunately, without a corresponding converter for the 40-column output, the existing one for the XEP-80 is almost worthless. Anyone out there who uses both 40- & 80-columnn displays knows that most software still uses 40 columns so you're always switching back & forth from 40 to 80. BobTerm is most notorious for this. So if you had your XEP-80 modified for TTL, you end up requiring TWO different montors in your system: CV for 40 columns & TTL for 80. This is no help, it only makes things worse.

This TTl converter idea has been listed in AC's "Dream Street" columnn for 2 (no, make that 3) issues now, & no one apparently is interested in seriously developing the idea. A pity. Because not only is it possible, but there is money to be made by who ever offers this thing for sale as a simple hardwre "black box" adapter.

>[...]

My problem is the reverse. I would like to find a way to convert the RGB signal from a couple of arcade video game motherboards I have to a composite signal (or better yet, Commodore video - luma/chroma) to feed into the 1702.

I posted on this a few days ago on comp.sys.cbm, but so far no one has been willing to tackle the question, so I thought I would follow up on this thread.

If you know the answer, then this is probably redundant, but just in case:

The game motherboards have the following outputs: red, green, blue, ground, horizontal sync, vertical sync, and composite sync. As far as I can tell the horizontal scan rate is about 15 kHz. They work great on my multisync monitor which can sync horizontal 15-35 kHz.

Any information (even technical references) would be gratefully accepted.

Thanks in advance,
David Northcliffe

Yes, I've got DOS 3.0 (and DOS 2.0 or 2.5). Can I convert my Atari DOS 3.0 (single or double density, whichever, I've got a 1050 drive) to MYDOS or SpartaDOS, and then convert that to IBM DOS 5.0 or some other version? All the files I want to convert are text files.

Thanks,
Jeff

Oh, I should also mention that I have access to an Atari 1040 ST and have a
version of gulam which will write 3.5" disks that are readable on IBM.
So, is there a way to hook my 5.25" 1050 to the 1040 ST, transfer it to there,
and then put it onto 3.5" (double density)? Then I'd be fine too.

Thanks again,
Jeff

I do not think that there is anything wrong with your drive.
After formatting the disk the head goes to track 19 (I think) to write the directory sectors. A disk that has just been formatted will NOT boot. It will load 3 sector (like you described), then stop. It sometime will also go into the mode of turning the motor on then off in about 2 second intervals. You must use your first DOS disk and Write DOS FILES to disk before you can boot with the new disk. If you have anymore problems let me know. I've been using an Atari 800XL since 1984. I should be able to help with just about anything.

897. Re: CV to TTL Video

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-25 04:28:45 UTC
From: Jim_Johnson@abcd.houghton.mi.us
Message-ID: <Jim_Johnson.0dtx@abcd.houghton.mi.us>
Source record: 107558

I'll summarize earlier messages that indicate that using a TTL monitor with the Atari 8bit's composite video output is difficult - true; and that composite video monitors are getting hard to find - also true.

A simple suggestion however is to hook your Atari up to the composite video input on a video cassette recorder (VCR). Also, many of the newer, better than average television sets now have a composite video input and do not have horrible overscan problems.

If a monochrome monitor is desired, most of the inexpensive monitors for security systems also accept a composite video input.

BTW, for less experienced 8bitters: Your Atari can make a glitzy, inexpensive video title generator when combined with a VCR. You can even animate your message by writing a little code.

> all input/suggestions. Thanks, Bob
>
>

Bob,

Solid amber usually means the GTIA didn't go through the
reset operation that the colleen operating system puts it through
at the start. This means the cpu probably isn't able to run-
could be bad roms, could be bad chip select, could be bad cpu,
could be bad address or data bus, (fractured pc or open pc trace).

It requires a complete diagnostic by a tech to decide what
the problem is. Not a simple fix, believe me.....sq

(they sold it because it was broken my guess- and was told it was
not worth it to fix. Use it for spare parts if you don't want to
troubleshoot it or pay someone else to troubleshoot. By the way,
all the addressing for roms, ram, and IO devices goes through the
slots- make sure that they are not corroded- use a continuity
tester to check pathways most accurately.......)

Jos,

You can't use VGA unless you are using a multisync
monitor. The scan frequencies are MUCH faster on VGA and the
number of scanned lines are much higher as well. NEC multisync
color monitors should work ok for the project, but as I said
before, it would require decoupling the colorburst, etc.......sq

Yep, that's it. For a good example of how to access the parameters to the
function, see the BZERO.M65 file in the library source.

> I have the Lib_Source, and to reproduce the c.olb is this what I would have
>to do: CC65 <all *.c filenames>, RA65 <all *.m65 filenames>, and then use
> LIBR65 <on all the *.obj filenames, except for RUNTIMEE.OBJ>

Yes, if you want to re-compile the entire library, but you can work on one
at a time if you wish; LIBR65's A option will replace the old .OBJ file with
the new one, not just add a duplicate.

> I hope I have everything down pat now. I took another look at the libsrc

Subject: Great new videogame 'Zine!

The Videogame Trader

Is a bi-weekly publication of classified ads relating to video games
from Arcade games to Atari 2600 to Super Nintendo to Computer Games
to Sega Genesis to Neo-Geo. Any and everything video game related
is included. The ads are cheap (from 7 cents per word).

Just sent $1 and your address for a sample issue to:

The Videogame Trader
P.O. Box N664
Westport, MA 02790

Try it, you'll like it.

(P.S. you get a free 30 word ad with your 1 year subscription!)

909. Looking for Sparta_Dos X

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-26 18:53:04 UTC
From: ai792@cleveland.Freenet.Edu
Message-ID: <1ovjeg$n9t@usenet.INS.CWRU.Edu>
Source record: 107571

I'm looking for a place to obtain Sparta Dos X. I'de prefer it to
be relatively cheap, and with manuals. But if worse comes to worse,
perhaps I'll just buy it brand new.

Thanks
ai792@po.cwru.edu
clisowsk@mcs.kent.edu

910. Water Damaged 130XE

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-26 19:19:45 UTC
From: alatino@Bonnie.ICS.UCI.EDU
Message-ID: <9303261119.aa24747@Bonnie.ics.uci.edu>
Source record: 107572

I was wondering if anyone knows where one could get a 130XE repaired in the Southern California area. During the recent rainstorms here in California my uncle's roof leaked all over his 130XE. The computer comes on but most of the keys on the keyboard do not work. We took it apart and dried it out, but the clear plastic strip under the keyboard looks like it needs to be replaced. Any ideas where he can get it fixed?

Thanks,
Andy

I also know of several people with keyboard problems for the XE and 800XL.
Is there an easy fix out there? Or at least an inexpensive one?

912. The 2600 Asteroids and Lynx Gates of Zendocon Mystery- The solution

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-27 03:57:22 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <B7X21B1w165w@cyberden.sf.ca.us>
Source record: 107574
Cross-posted to: rec.games,rec.video.games,comp.sys.atari.8bit,alt.games.video.classic

Welll... it's been a while, and I've only got two responses via e-mail
(as I instructed) - both were "well, what IS the link?"

If you don't remember, a week or so ago I posted a message stating that
there was a mysterious link between the old Atari 2600 game "Asteroids",
and the newer Atari Lynx game "Gates of Zendocon."

Well...guess what.

There is none/

Can you believe it!?
NONE!

JUST KIDDING!!!!!!!!!

I have a Lynx brochure I picked up about a year ago at San Jose computers
that's shaped like a Lynx, and listed titles such as Calif.Games, Blue
Lightning, Gates of Zendocon, etc. and had info. on "coming soon" releases
such as Xenophobe, Klax, etc... remember, this was from 89 or 90.

WELL... I found this brochure after having it tucked away for quite a
while and looked at it again. Then I noticed something. The picture
they had for Gates of Zendocon had the SAME SPACE-SHIP drawing as
Asteroids!.... or did it? So, I went and flipped thru my 2600 title
instruction booklets, and found Asteroids.. I compared the two...here's
what I came up with:

The first thing that made me remember asteroids was that funny
glowing red "engin" or weapon powersource or whatever underneath
the ship

The next similarity was the actual shot coming out of the ship...

Then I looked and noticed that this picture's ship looked almost
identical to the old 2600 one (this was before I compared, remem-
ber...), except it looked more ... modern. Not as painting-y.

When I compared I found these:

The ship was at a totally different angle.
Some of the paneling designs on the ship were a little different,
but MANY MANY of them were identical to the 2600 one!
The tail "fin" was missing... like you find on airplanes.
SOme of the bigger panels were identical, and even the colors of some
of the lights (like close to the edges of the wings)

FINALLY, the most stunning one was this:

The explosion on the Gates'o'Zendocon picture was IDENTICAL
to the Asteroids one! COMPLETELY IDENTICAL! ... even some of
the shock-wave-like brush srokes! If you look closely, you'll
notice that the explosion ont the G'o'Z picture has bits of
rock flying around..... I WONDER WHY!?

Pretty nifty, eh? SOMEBODY who drew this picture must've either
been lazy, on a tight schedule, or, like me, a person who just LOVES 2600
Asteroids!

WOW

913. ColorView UNSquasher

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-27 08:34:57 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <y1a31B2w165w@cyberden.sf.ca.us>
Source record: 107576

I made a small hack to ColorSquashView which loads another program I made, (which I spend long enough figuring out! grr!) which takes the 22+K of image data and resaves it as uncompressed .R, .G, .B files!

YAY!... now you can go both ways! From .R, .G, .B -> .RGB, and back to .R, .G, .B!

Main reason I made it was because I had a GIF -> CV9 -> CVS9 and I only saved the CVS9 (the squashed), not the GIF or the .R, .G, .Bs.

And the only way to edit this image was to resave it as .R, .G, .B. (oops, it wasn't a CV9, it was a CV15.. been xverting Japanese Anime 16 color hi-res GIFs into CV15 mode. Looks EXCELLENT!!!) Anyways, it works, and I was able to edit. Unfortunately, I did make one slight mistake at first (corrected now), it accidentally switched green for blue! heheh! WHOOPS!

BTW- reason it's so tough, try changing the POKE 559,0 to a POKE 559,34 before the program loads, and you'll see how the RGB data is stored... not as seperate screens, but as BLENDED (sort of interlaced) screens.

Tough to deal with! :(

but it works nICE

914. German disk based 'TOP-Magazin' on the archive

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-27 13:47:16 UTC
From: Marek Tomczyk <UJ1G@DKAUNI2.BITNET>
Message-ID: <1p1lt4$7gm@nz12.rz.uni-karlsruhe.de>
Source record: 107575

Hello,

As you all know, there are many disk based magazines around the
world dealing with the Atari 8-bit.

Here's another one, i.e. not exactly here but on
'atari.archive.umich.edu'. It's the German 'TOP-Magazin' released
by the TOP-Crew known for some excellent demos as well.

I've uploaded the most recent issue I have, i.e from February 1993.
Many thanks to Michael Goroll who supplied me with this issue.

Check the 8bit/Demos directory for

top9302.txt
top9302a.dcm
top9302b.dcm

which are a short blurb and two sides of the magazine.

This magazine should be interesting to people who don't speak/read
German as well. Side two of the disk contains a demo version
of the new Polish game "Miecze-Valdgira" along with another
demo from Poland.

Maybe a German-English dictionary could help you to read some
articles from side one as well. Shouldn't be that hard. It's worth it!

Enjoy,

Marek Tomczyk

The Atari Hardware Book
26 March 93

We're moving right along. Through the efforts of Ryan Osborne, we've got a substantial portion of the material that's been published in Zmagazine. The material we've got so far will start finding its way into digital form (Andrew Diller will be scanning printed articles, etc.).

We're still looking for material! Early issue of Antic and Analog need to be combed. There's got to be more than a couple books on hardware projects for the Atari than those I've seen. Dig around! Look in the bottom of that closet!

If you've got anything, let me know. Send e-mail to me (at the address shown below)!

As an indicator, we've got about 80 articles in the database right now. I hope there's more than that out there!

David Anderson

Hi everybody, I have a 130XE and I use it sometimes as a terminal for a network system. I've been using an xm301 modem but its 300bps is too slow. I have a 850 interface lying around and I want to know if a 2400bps modem for the ibm can be used with this interface, is this too fast for my 130?, should I use a 1200 modem? Which programs will work this this modem? anyone good at the atari ftp site?
Has anybody done this?
Ok, too many questions.

Any help will be really apreciated.

The speed limit is set by your 850. It can only go up to 9600bps.
I believe there are several programs on the umich archive site that will
support up to this speed.

Source record: 107581

Yes you can use the 850 and it works quite well... you are, however, limited to 9600bd. Using Bobterm, you'll have no problem with characters dropping out due to buffer overflow. Using K65 (from the archive) you get character loss if the screen is scrolling as new data is coming in. if the screen is cleared between pages, you lose nothing at 2400 bp...

Ed wanted to know about hooking a hard disk to his 8-bits. The
ICD MIO and the Bob Puff's Black Box are the only ways to do that.
ICD no longer sells the MIO. CSS 716-429-5639 (N.Y.) still sells the
Black Box, I think. But, really, I doubt you're gonna want to do
what you say you want to do when you find out how much it is gonna
cost.

Hello,
I just bought a 130XE (with little manual, tv cable) and a 1050 disk drive.
Both have their power supply boxes. But it didn't come with a cable that goes
between the computer and drive. What kind of cable is this, and where can I
get
one. Also on the drive power supply the end that doesn't goto the computer
ends in a two prong plug (not a normal elect. plug). What does this fit into?
thanx for the help.

I just saw this article in Znet Atari Online magazine (#93-09) and thought it was worth taking out and posting here since many of you might not get Znet Online. Since we are always looking for sources of Atari 8bit software, etc. it is a good idea to check out every lead. This company claims to support Atari 8bits, so you might want to give them a try.

```
####### PMC UPDATE
####### CompuCycle/CompuNews
####### ------------------------------------------------------------
```

CompuCycle (TM): Saving the Environment
CompuNews (TM): Informing the Community

Bellevue, WA - Purple Mountain Computers (PMC) has developed a recycling program for computer books, magazines and software. Users can buy, sell and trade their unwanted items for ones they do want. Trial testing of the CompuCycle (TM) program has been a success. All computers are supported including PC, Mac, Amiga, Atari ST and 8 bit, Apple, Commodore 64, CP/M, and others.

Book topics include a wide range of subjects including programming and tutorials. Our inventory includes over 10,500 computer books/magazines and 1,100 programs. Wharehouses are located in Washington and California for quick delivery.

We believe that everyone can benefit from this program. Users will pay less for software and can turn unused programs and books into cash or wanted items. And society will benefit from the utilization of our current resources, instead of wasting new ones.

PMC publishes CompuNews (TM) which includes the list of available recycled software. It also has current news and fascinating articles (the next issue includes an interview with members of the Floptical Technology Association). CompuNews (TM) is free to anyone who requests it.

Thousands of books are listed on disk to conserve paper; this disk catalog is available for just $1. Software is listed in CompuNews (TM) which is free. Users can make requests by contacting us:

The Atari ST mouse can be used on the 8-bit atari computers without
modification. At least this is true with the Missle Command cartridge
(using the CNTL-T option for Trak-Ball).

Look what you can get for only $500. It's the perfect starter system lacking only
a printer and we can talk about that! I need to sell this system so that I can pay
my taxes. It works great and you'll not find a comparable system anywhere at this price.

Atari 1040ST (M68000 16bit GEM based GUI system)
W/Rainbow TOS 4.1
2.5MB RAM
3.5" 720k internal floppy drive
1 Parallel port
1 Serial port
1 DMA port
2 Mouse/Joystick ports
2 Midi ports
1 Cartrage port w/clock
1 Floppy drive port
1 HiRes Monitor port

1 Color Monitor
1 HiRes Monochrome Monitor
1 Monitor Switch Box
1 External 40MB Hard Drive
1 External Indus GT 3.5" 720k Floppy Drive
1 1200baud Modem
1 MagicSac Mac Emulater Cartrage w/ROM's

And TON$ of Floppies, also software and manuals and misc odds
and ends.

*** At this price, you pay for shipping. ***

Again, I am only asking $500 for the complete system. If interested, reply
via E-mail, Here or Call me at 503-696-5910 before 7pm and at 503-649-4748 after 7pm PST.

And please folks, no flames. If you're not interested then ignore this post.

Well, after trying to connect that burnt up XMM801 of mine (the one that started smoking a week or so ago!) and finding that one SIO port didn't work properly, I decided to pop the sucker open and see what's up.

When I disconnected the light/button plug and got the stupid cover all the way off (grey wire towards the front ;)), I checked out the SIO ports.. just by looking I could tell that a few of the pins must've been overloading because their circuit pathwas were brown and charred! YIKES!

Well...what could've done this? What did I have connect to that port when it happened!?

Only one thing... my modem. I've always set the modem (an SX212) at the end of the daisy chain, because it only has 1 SIO port.. just like my 1200xl. (that really sucks you know! I mean, there's space for a second on the 1200xl at least!) ANYways... now, why would the modem do such a thing?

My DUMB TERMINAL! NO WONDER! I've noticed that when I have my dumb terminal hooked up the modem makes funny noises when you turn it on (sometimes really loud screeches! It's horrible!) and when the speaker is on (dialing and initially connecting). Well... here's my current dilema.

I DON'T WANNA LIVE BY SWITCHING SIO CORDS BACK AND FORTH! WHAAAA!!

Argh.. Well... I already know of some possibilities.. get a Quintopus and have all the ports I'll ever need (for now hehe) but the thing costs $40! :(

or... I could jump up and down and scream at myself for being so stupid, and end up living with switching the plugs around whenever I need the printer.

or.. I could find out where to get a new SIO port chip for my XMM801.

OR...(this one I like, even tho the price may be over $40) get a nice FAST printer... (anything over 80cps draft...I mean, hell, my XMM801 is 80cps, and there IS no draft/non draft! BLEAH!) and see if I can mooch an MIO, BB (ha!) or P:R:C from somebody.

Soooooooooo any other ideas? (no flames for being so dumb, either) (hehehehe)

THanx for listening hehe

WELL.. I've borrowed a copy of SRII from a friend, and I must admit, it wasn't as bad as you all said it was. Then again, it could be better. I'm sure I'll still prefer SRI over II any day. BUT... I don't see why you call knocked it so much. Some how somebody had convinced me that it's not 3-d. Well, sure, it's not true 3-d like SRI, but it's not an overview style game either me'laddies!

Anyways... I really liked SRII once I got it to work..

THEN... the NINTENDO SYNDROME kicked in... it got BOOOORING!

Sure..the cool solar system maps with all the colors and nifty DLIs and the funky (yet 80% pointless) control panel and such add a LOT to the game, (NOT to mention the snazzy enemy animation), but it did get pretty boring after shooting up a few 100 fighters and finally getting blown to smithereens by one of those REALLY big ships.

Inotherwords... It's ok. It's not as bad as everyone says it is, but if I were you, I'd not buy it for more than $15 nowadays.. It looks like it was pretty top-notch stuff for the days tho!... (not vs the fact that SRI was written in 1979!!!)

And here's another note - it wouldn't run on my Woolley'd 1200xl. My old 1200xl with the stock motherboard and standard 1200xl OS runs it like a charm, but my 1200xl with 256K RAMbo and EPROM'd 800/800xl OS stuck in the standard 1200xl sockets just gave me an obnoxious green screen and wouldn't even RESET w/o being powered off/on!

Soo.. looks like I'm not getting this game too soon! ;)

Just thot you'd like to know

(why is it I feel like these last 2 posts are going to be completely ignored!?!?!? :( )

school I guess. :)

I have a bunch of Atari 8-Bit hardware I want to sell.
I have the following:

130XE - 576K Expanded Memory
20 Meg Hard Drive Setup for 8-Bit
include: casing, fan, power supply, adaptor for
130XE or 800XL.
PR Connection
include: both modem and printer cable.
SpartaDOS X Cartridge
1200 Baud Packerd Bell Modem
1020 Color Plotter
Indus GT 5-1/4" Drive DD DS
1050 Disk Drive
include: 1050 Doublers (better than US Doublers)
Write Protect Swtich
1050 Disk Drive
2 5-1/4" Hole Puncher
Atari Writewriter Cartridge
2 Joysticks
Broken 65XE
Boxes of Disks
Computer Manuals

All hardware comes power supplies and cables, plus most manuals.

Everything sells as a whole for $325.00 plus shipping.

Send E-Mail to "bong@brahms.udel.edu" for more information.

Source record: 107597

/ iftccu:comp.sys.atari.8bit / alatino@Bonnie.ICS.UCI.EDU (- Andy Latino -) / 11:19 am Mar 26, 1993 /

I was wondering if anyone knows where one could get a 130XE repaired in the Southern California area. During the recent rainstorms here in California my uncle's roof leaked all over his 130XE. The computer comes on but most of the keys on the keyboard do not work. We took it apart and dried it out, but the clear plastic strip under the keyboard looks like it needs to be replaced. Any ideas where he can get it fixed?

Thanks,
Andy

American Techna-Visions sells 130XE replacement keyboards for $35.00
Call them @ 1-800-551-9995

Also, I remember some outfit selling "improved" 130XE keyboards (ones without the mushy feel to them). I'll try to find out where it was I heard about those.

Bob

936. CVSquash2.arc

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-30 23:39:48 UTC

OK now I got Color View Squash 2 with docs and source code, debugged.
I'll send it to the archive as soon as I figure out how to trick
youngstown freenet into sending a 40000 plus byte file...hmmmm....
maybe I can send it in 2 or 3 files.
Anyway the CSviewer is faster now....here's the list of files
that are in the arc:
CVSQUASH
CSVIEW
CSVBETA
EXPAND.SRC
COMPRESS.SRC
DISPRGB.SRC
CSVIEW.DOC
CVSQUASH.DOC

The file had a sample pic in it of Amy Squirel but I took it
out to save space.
The program is written by E. Halliwell and is shareware.

937. TOP9302B demo (side two of TOP 93 demo at archive)

Newsgroup: comp.sys.atari.8bit
Date: 1993-03-31 01:38:22 UTC

Message-ID: <Ne791B1w165w@cyberden.sf.ca.us>
Source record: 107599

Hmmmmmmmmmmmmmmmmmmmmmmmmmm.. That "DAXEY" demo won't work on either my Woolley'd 1200xl (with the 800/800xl switchable OS ROMs) OR my stock 1200xl!

DOes this thing work at ALL on 60mhz NTSC systems? I get a bunch of messy screens (like you see when something is "unpacking" into RAM) but that's it... after a few seconds of different "styles" of "unpacking" screens it just sits there black and dead.

Any help? Is it just MY copy?

grr

>Hello,
> I just bought a 130XE (with little manual, tv cable) and a 1050 disk drive.
>Both have their power supply boxes. But it didn't come with a cable that goes
>between the computer and drive. What kind of cable is this, and where can I
>get
>one. Also on the drive power supply the end that doesn't goto the computer
>ends in a two prong plug (not a normal elect. plug). What does this fit into?

This should be a normal electric plug, unless you got one that was made for another country. The power supply should have a label showing input and output voltages; for the 1050 disk drive it should be 120V in and 9V AC out; the computer power supply should be 5V DC out. If you did get a foreign model computer, you might have trouble using it with American TVs or monitors.

The computer to disk drive cable is available from several mail order sources including Best Electronics and American Techna-Vision. They also sell power supplies if you need one.

947. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-01 15:33:17 UTC
From: CURRENTM@carleton.edu
Message-ID: <01GWHQ3SCVMQ8Y5OSF@carleton.edu>
Source record: 107509

To do: add pinouts for ALL ports on the 8-bit, plus the 850 and XEP80.

Also, I've been working with Ray Wilmott's vendor/developer list. I haven't decided yet whether to include it in the FAQ List, but either way I'll probably post it separately in a few days.

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 30-Mar-93

Additions/comments/corrections having to do with this FAQ List are welcomed by its creator and maintainer, Michael Current, currentm@carleton.edu.

The 8-bit Atari FAQ List is posted on or about the first of the month to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion group. At this time the FAQ List is heavily geared toward describing the various resources for the 8-bit Atari user available, with relatively little information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the moderated newsgroups news.answers and comp.answers. Hence no automatic archiving of this FAQ List occurs, though there's usually a fairly recent copy on the Atari Archive (see below) as the file 8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet side of this discussion group. All postings to comp.sys.atari.8bit automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari computers (400, 800, 1200XL, 600XL, 800XL, 65XE/800XE, 130XE, and XEGS) is valid on comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.st, comp.sys.atari.st.tech (ST/TT/Falcon)
comp.sys.palmtops (includes Portfolio)
rec.games.video (includes 2600, 5200, 7800, XEGS, Lynx)
alt.games.lynx (Lynx)
alt.games.video.classic (includes 2600, 5200, 7800, XEGS)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the

Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will not be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari computers (400, 800, 1200XL, 600XL, 800XL, 65XE/800XE, 130XE, and XEGS) is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning, jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu.
The Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP
a) FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4)
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1)
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to

retrieve any files available from anonymous FTP sites on the Internet, including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of your message says:
help

What are the News-Disks?
The Atari 8-bit News-Disk ("News-Disk") is an on-disk Atari 8-bit only magazine from the UK. It is sent on-disk to subscribers in the UK, but is also made available to people with e-mail or FTP access. Each issue is supplied in ARC format. They are not in straight text format like Z*Mag. Each issue contains articles on various aspects of the Atari, along with programs in Basic, Turbo-Basic, and M/C. Some issues also contain .PIC files (viewers always included), speech files, and some others. Every issue contains a copy of XR_40 for viewing text files on the screen, and a copy of a simple program to print articles. Alternatively, you can read/print from any word processor. Each issue should be unARCed onto a single density disk with a copy of DOS 2.5 DOS.SYS on.
All issues are at the atari.archive. They are accessed by '/atari/8bit/Djg/issueX.arc' where X is the number of the issue desired. To submit articles, mail djg0@aber.ac.uk.

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it is the hub system of the NPTN, the National Public Telecomputing Network. Anyone can access the Free-Net via modem at (216) 368-3888. Those persons with full Internet access can TELNET (this does not mean FTP) to freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts are handled online. Once logged-in, type "go atari" to reach the Atari SIG. Those who add their names to the Atari SIG user directories are automatically members of the official Atari user group CAIN - Central Atari Information Network. Send correspondence and press releases to xx004@po.cwru.edu.

What product developers or vendors support the 8-bit Atari?
Ray Wilmott maintains a list of current 8-bit Atari vendors and developers

which is too long to include here. Contact him at wilmott@remus.rutgers.edu

What is an .arc file?
A file with the extender .arc has been archived, in a standard manner that is common in the IBM-PC/MS-DOS world. This is done to make the file shorter, so it takes less time to transfer between computers. The atari.archive contains an un-arc'er called supunarc.com for the 8-bit Atari. The companion program is called superarc.arc (use supunarc.com to un-arc it). Each is compatible with the MS-DOS equivalent.

What's this UUEncoding stuff all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. The file uudecode.bas (the documention file is uudecode.doc) is at the atari.archive. It's in Atari BASIC text format (ENTER it into Atari BASIC). The file yau.arc contains yau.com, a machine-language UUdecoder, and yaue.com, a UUEncoder for the 8-bit Atari. A newer (better?) uuencoder/decoder is contained in the file 8bit/Utilities/uue.arc. Each is compatible with the UNIX equivalent. UUEncoded files are normally given the extension .uu, but the 8-bit Atari world has decided to use .uue for some reason.

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett
Reads/Writes SS/DD 180K Atari disks. Archive filename: dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman, modified by Kevin White
Reads SS/DD 180K Atari disks. Archive filename: atario21.arc

SpartaRead by Oscar Fowler
Reads SS/DD 180K SpartaDOS disks. Archive filename: sr.arc

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
It all depends on what type of computer you intend to connect to. For connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite. For connecting to larger computers, you will need a VT100 emulator. Several are available for the 8-bit Atari, each with its own advantages. Kermit-65 is a VT100 emulator, provides Kermit file transfer and an 80-column screen display, but does not support the XEP80. VT850 is a VT100 emulator that supports the XEP80 but provides no file-transfer. OmniCom is a VT100 emulator providing both kermit and xmodem file transfers, plus an 80-column display, but does not support the XEP80. Each of these programs is known to work with the SX212 Modem connected to the SIO port, and to work under SpartaDOS and MYDOS; each program is available at the atari.archive.

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)

1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

End of FAQ List.

948. What's up with the FAQ?

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-01 17:09:25 UTC
From: wbdst+@pitt.edu
Message-ID: <7492@blue.cis.pitt.edu>
Source record: 107510

I just read the FAQ, and it lists the * 800XL as having 64k RAM.
Is this right? I thought it had 48k RAM...

949. IBM<=>Atari 1050 transfers

I agree that it's not a bad game, but it was around long before it was
called SRII. It was first The Last Starfighter, after the movie was
released, Atari had created a 2600 and 8-bit game. (If you look at the
credits in the movie, you'll see something like 'Video game release
available from Atari Corp.' or something like that.)

Are you sure? I've watched the movie several times, and play Star
Raiders II once in a while, and I really didn't notice ANY similarity
between that game and the Last Starfighter. Yeah, I noticed the line
in the credits-- but Star Raiders II == the Last Starfighter? An
interesting assertion, but I remain skeptical...

953. cvsqush2.uue in archive

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-01 22:57:21 UTC
From: ab588@yfn.ysu.edu
Message-ID: <1pfs0h$oem@news.ysu.edu>
Source record: 107513

```
The new complete cvsqush2.uue is in the 8bit/New directory here is
a short of what the program is:
*********************************
Name: CVSQUSH2.ARC
by E.HALLIWELL
Date: 930313
Approximate # of bytes: 30208
Description:
This is the COMPLETE version of ColorViewSquash/ColorSquashView,
with full documentation, including file format description, source
code files for the compress, decompress, and display routines,
and a sample file.
This ARC fixes a few glitches, and has a faster, much-improved viewer.
These programs take the separate R,G, and B files APACView generates and
puts them all in ONE file, then compresses it, along with the mode
data and a 40-character description.

954. Cracks needed for archiving (honest!)

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-01 23:33:58 UTC
From: wbdst+@pitt.edu
Message-ID: <7578@blue.cis.pitt.edu>
Source record: 107515

I have recently purchased an 800XL, and have revived lots of cool 8-bit software which has been buried in the musty archives. I have been able to copy everything to new disks (to make sure I don't lose anything), except for 2 games: TAC, a tank game from Avalon Hill, and Mech Brigade, a strategy game, from SSI. You guessed it: copy-protection. Before any yells at me, I DO own these games. Now, does anyone have cracks for either of these two? Even if you could just tell me what to do... I have the original disks. I think TAC has a bad sector protection system, but I don't know what to do about it. Any help would be appreciated, thanx!

I was wondering if anyone else knew that; I had my hands on a copy of "The Last Starfighter" a couple years ago. I don't know where it is; I wouldn't play it after I found out that it had been released as SR2.

Does the Enterprise still make a very rare appearence in the commercial release? A teeny-tiny little NCC-1701 zipped across the horizon once when I was hovering over the yellow star to refuel. Also, did they improve the "melting" sequence?

It is true because I have both games and they are similar. I remember there were a few changes between them. Names, and such were different and something else.

Graphically the same game though...

Anyone wanting further info. E-mail me and I will fire up the two and compare anything that you want to know.

957. VT100 emulation and the 130XE is it possible?

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-02 03:25:04 UTC
From: galileo@bsu-cs.bsu.edu
Message-ID: <3975@bsu-cs.bsu.edu>
Source record: 107520

I would like to know if anyone is using his 130XE to emulate VT100(or something else) that is considered compatable by dial-in VAX or UNIX systems. My campus has a dial in line, and I don't see it necessary to buy a PC just to have a terminal in my room.

The accessories that I see that could be needed are....

1) A terminal program that will emulate something like VT100, and preferably in 80 columns.

2) Wasn't there a thingy made to plug into the joystick port to turn the 130XE into an 80 col. terminial?

3) Also, does anyone know how I would go about interfacing a dataport plug into something that could possibly be interpretted by the 130XE?

I could always use a modem to dial in, but these ISN links are 19,200 baud, and I think that this would be much preferrable. If anyone has any ideas, or knows where I could obtain any of these products, my ears are open!

Down with C64!(sorry, just venting regressed feelings!)

Thanks in advance,
Eric Wallin
galileo@bsu-cs.bsu.edu

958. * 8-Bit Equipment For Sale *

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-02 03:32:03 UTC
From: bong@bach.udel.edu
Message-ID: <C4u75G.34D@news.udel.edu>
Source record: 107519

I have a bunch of Atari 8-Bit hardware I want to sell.
I have the following:

130XE - 576K Expanded Memory
20 Meg Hard Drive Setup for 8-Bit
include: casing, fan, power supply, adaptor for
130XE or 800XL.
PR Connection
include: both modem and printer cable.
SpartaDOS X Cartridge
1200 Baud Packerd Bell Modem
1020 Color Plotter
Indus GT 5-1/4" Drive DD DS
1050 Disk Drive
include: 1050 Doublers (better than US Doublers)
Write Protect Swtich
1050 Disk Drive
2 5-1/4" Hole Puncher
Atari Writewriter Cartridge
2 Joysticks
Broken 65XE
Boxes of Disks
Computer Manuals

All hardware comes power supplies and cables, plus most manuals.

Everything sells as a whole for $325.00 plus shipping.

Send E-Mail to "bong@brahms.udel.edu" for more information.

Re: 2400 too fast for 130xe?

Hell.. >19.2k bps< isn't too fast for a 130xe!!! :)

I know a guy running a 14.4k bps BBS with 125+ megs online, ANSI,
VT-color, ASCII, and AtASCII.

All in an IBM case with an IBM keyboard

;)

have fun! I don't think you'll even need a modem handler (driver),
because the 850 has one built in, right?

I need an 850.

(I think 1200bps is still too slow! hehe)

Re: MIO/BB only way to connect HD

What about that KP-interface. I'm still not too sure what that is.

And I'm still pondering whether or not to get an internal IDE HD in my
1200xl.

I wonder if Bob Woolley's made any advancement in his handler.

I still dont like the idea of simple HD -> RamDisk dumping.

I dont even use the 192K on my 1200xl for anything else but a RAMDisk and
I dont want any Software but MyDOS to be poking its nose in my RAMboXL!

;)

> get
> one. Also on the drive power supply the end that doesn't goto the computer
> ends in a two prong plug (not a normal elect. plug). What does this fit into?
The cable is an Atari SIO cable. SIO stands for Serial Input/Output.
They cost very little (like about $5 a peice) and many stores sell them.
BEST Electronics is one example: 408-243-6950 - in Calif.
2021 The Alameda, Suite 290
San Jose, CA 95126 USA

As for the power plug! Dunno.. perhaps it's a european style plug?
(2-prong? sounds like normal US plug to me!!?!?!) Again, I'm sure
BEST has a few.. they'll cost more than $5 a peice tho..

also, get at least 2 SIOs ... never know when one'll get to kinked in
your small desk (welll... MY small desk, at least ;)) or you get another
bit of hardware that doesnt come with its own SIO

later!

964. Re: VT100 emulation and the 130XE is it possible?

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-02 11:14:46 UTC
From: winston@merk.com
Message-ID: <C4usKn.qH@merk.com>
Source record: 107523

Well, hardware is not my strong suit, but KERMIT65 is quite capable of emulating a VT100 in software 80-columns at a speed of 1200 BPS over a modem phone link. I have no idea how fast a "hardwired" ATARI running KERMIT65 could go, but the slow clock speed and the software character mapping makes me suspect 1200 bps is good, while 2400 bps is pushing it for high-res screen drawing with a 1.89 mhz clock. Let me re-emphasize that I am --NOT-- a hardware person.

Something you --COULD-- try is an RS232C-to-RJ11 adaptor, assuming that your dataline uses an RJ11 phone plug and you are treating your hardware line as a serial data line. This would give you a dataline link, but I doubt it would be much better than using a modem. However, it will not tie up your phone line.

Something you could do is use KERMIT65 to do VT100 screen work, then exit KERMIT65 and load BOBTERM for lightning fast file transfers. Or, if your system has KERMIT, perhaps changing over from software 80-column graphics to hardware 40-column text cells might speed up your KERMIT transfers, but generic KERMIT without sliding windows has a variable packet size that really isn't much better than standard XMODEM.

Good Luck!

Yes, it's quite possible to do VT100 emulation with an 8-bit Atari.
I frequently use my 65XE to contact both our UNIX machines and our
IBM mainframe from home. I use an Atari SX212 modem and the VT100
emulator OMNICOM. It is a shareware product and is available from
the BART server. It supports XMODEM and KERMIT file transfer,
Screen to Printer dumps, customized keyboard layout and much more.
It also provides a full 80 column display without additional hardware.
The 80 columns are decent with a good monitor or b&w tv, but a color
tv's output is hard to read. The SX212's top speed is only 1200 bps,
but for the price of the modem and shareware contribution, you can
be in business.

Source record: 107527

How much is it worth??-> I bought mine in 1985 brand new for$179.95
when they were advertized for $149.95...The reason I paid more for
it was it was the only one they had and the 1st one they had and at
the time Atari was not giving too good of service to its dealers.
As a matter of fact the dealer had 2 atari stores and had to close
one of them cuz of lack of stock and the other was wiped away by
a tornado along with the whole Niles Park Plaza and a Roller rink.
So I guess I bought the 1st and last 130xe he had.

```
I have finally decided to sell my Atari 8-bit system,
it includes the following: (this is an updated list)

Hardware - 1020 color pen plotter/printer $10
R-TIME-8 cartridge $20

Accessories - 5 joysticks $3 each
1 set of paddles $5
1 ICD printer cable $5
1 ICD modem cable $5

Software on disk - SpartaDOS 3.2d $10
Bank Street Music Writer $5
The Converter version 1.51 $5
Print Power $10
The Print Shop $15
RAMbrandt version 2.0 $10

Games on disk - Alternate Reality - The City $10
Alternate Reality - The Dungeon $10
Artic Antics $10
Boulderdash Construction Set $10
Chessmaster 2000 $10
David's Midnight Magic $5
F-15 Strike Eagle $7
Hacker $7
Jawbreaker $5
Jewels of Darkness $5
Leaderboard Dual Pack $10
Master of the Lamps $7
MRCA Mach 2 $5
Pinball Construction Set $10
Silicon Dreams $5
Trail Blazer $10

Books - Basic Atari BASIC $7
Mapping the Atari, revised version (includes XL stuff) $10
DOS 2.5 manual $7

Magazines - ANALOG Computing issues 44, 45, 46, 49 (7/86, 8/86, 9/86, 12/86)
Antic: July, Aug/1985
Dec*/1987
Apr, Dec*/1988
* these issues include the disk
```

I also have over 50 dd/ds SpartaDOS formatted disks with
shareware/public domain/magazine software on them...

If you are interested in any of the above please contact me...

Hmmmmmmmmmm..... I think I'd REALLY like these two!

I feel I'm in great need of a HD and a faster than 1200bps modem!

How is the HD connected? MIO? Does it require a PBI port? (I have an
Atari 1200xl and it has no PBI port.. I have the 13-pin SIO port,
cart.port, 2 Jstick/etc ports but no cool PBI)

I'll still take the PR for a GOOD price

thanx!

Yes, the 800XL has 64k RAM, although the top 16k is only used by a few
programs such as Turbobasic and Spartados. All the XL and XE systems, except
the 600XL, have at least 64k.

Nope, LOTS of programs use all 64k. Anything that needs to be booted with OPTION held down, for a start... (I think Spelunker does this... My all-time favourite game; also the only one I've ever completed without cheating ;)

I am looking for a device that will enable the 130xe to have a modem
connected to it. I believe a 850 module or a P:R: will do the trick.
If any one has one for sale please send e.mail to me not at the above
but at: andy-w@ersys.edmonton.ab.ca

Message was posted at outlan.ersys.edmonton.ab.ca

> cheating ;)

No, that would mean Spelunker wouldn't run on the 400/800... and Broderbund wasn't about to alienate all those owners, eh?

Holding OPTION on boot turns off the internal BASIC and almost all commercial games required it.

There are many XL/XE only applications and games (Gauntlet, the arcade game, for example)... well, lets say, some. Even those required OPTION, they wanted the upper memory.

Obviously, there's a hardware connection involved; I would be satisfied (I suppose) with a single file on the mac acting as an Atari file system; this might be easier to implement software-wise.

Any thoughts?

I'd be happy to add info on Turbo-816 to the FAQ List, but I don't know enough
about it to write anything intelligent.

Could someone please post a little summary of it? Thanks.

Has anyone here successfully used the copy of VT850 that's on the Archive?
Jeff McWilliams was trying to get it running a couple weeks ago, but without
luck.

Since I'm the one that uploaded it to the archive, I'm nervous that I messed up
the upload somehow.

Hello all,

Has anyone out there successfully used the QWK mail reader programs
for the 8-bits that are available in the Archive? I have tried using
Qwksilver and it freezes up after reading the control.dat file. When
I tried the PABQWK reader, I keep getting errors from the 'runtime.com'.

Thanks for any info on this.

983. Fax on the 8-bits?

Newsgroup: comp.sys.atari.8bit

Does anyone out there know it the 8-bits could send and receive faxes?
It would be really cool if the old 8-bits could do this, with the
right modem and software offcourse.
Thanks for any info on this.

Yes it disables BASIC, but in doing so it frees up the address locations
used by the BASIC ROMs, and they are available for use as RAM locations.
That's why you get a different number of little squares for the self-test
with and w/o BASIC.

>There are many XL/XE only applications and games (Gauntlet, the arcade game,
>for example)... well, lets say, some. Even those required OPTION, they wanted
>the upper memory.

Many applications which don't use BASIC require you to disable it, regardless
of the amount of memory used. Applications which use more than 48K won't
run on the earlier 400/800 models.

From: winston@merk.com
Message-ID: <C4yvws.7B0@merk.com>
Source record: 107547

On April 3, 1993 at 23:22:55 GMT
aj227@yfn.ysu.edu (Matthew A. Topinka) says:

MT> Has anyone out there successfully used the QWK mail reader programs
MT> for the 8-bits that are available in the Archive? I have tried using
MT> QWKSILVER and it freezes up after reading the CONTROL.DAT file. When
MT> I tried the PABQWK reader, I keep getting errors from
MT> the 'RUNTIME.COM'.

I got exactly the same errors as you described when I first tried
running QWK-SILVER and PAB-QWK on my stock ATARI 800XL. Here is the answer
to your questions:

1.) "I have tried using QWKSILVER and it freezes up after reading the
CONTROL.DAT file."

o What you are describing is a bug that I discovered and
reported to the author in his first release of QWK-SILVER, which the author
now describes as the "D2:" bug. What happens is the following:

A.) QWK-SILVER, after setting up the CONTROL.DAT files, proceeds
to look for the "HELLO" bulletin file on "D1:".
B.) QWK-SILVER, not finding any "HELLO" or "WELCOME" bulletin
file on drive one, now goes and looks for any "HELLO" or "WELCOME" bulletin
file on "D2:"
C.) If you have no "D2:" drive, QWK-SILVER locks up!!!

...what the program was --SUPPOSED-- to do, was to take a look at
the "CONFIG" setup drive table each time, to see if a drive existed before
accessing it... --BUT-- QWK-SILVER --IGNORES-- the setup parameters and
configuration table completely. The author never bothered to test for a
--ONE-- drive system, assuming that every ATARI user in the universe had at
least two or more drives, like he did. (NOTE: Supposedly this "access D2:
whether D2: exists or not..." problem has been corrected in the latest
release of QWK-SILVER.)

SOLUTION: The first release of QWK-SILVER --MUST--... absolutely
--MUST-- be run on a two-drive system where a second drive has been plugged
in and turned on, or a RAMDISK is present as device "D2:". It will not run
otherwise! Get the latest release of QWK-SILVER if you need to use it on
only one drive (like an XF551 or 3.5" drive).

2.) "PAB-QWK reports an error in its RUNTIME.COM module."

o PAB-QWK will only run on a 130XE that uses XE entended
banking! The program PAB-QWK will crash on any other ATARI computer which
isn't hardware copatible to the ATARI 130XE. PAB-QWK will not run on an

400, 800, 1200XL, 800XL, 600XL, or any of the earlier computers.

ADDENDUM: There are some excellent notes about the "QWK" message format included with the "QWK-SILVER" executible compiled TURBO BASIC modules. It turns out that the "QUICK" message format is actually quite simple. It is fairly easy to prepare a TEXTPRO Macro module that will read the ".QWK" message packets. Likewise, TEXTPRO is quite capable of creating reply ".REP" QUICK message packets, provided that the user can supply some type of "time-stamp" for the clock field. Strictly speaking, it is not necessary to require either dual drives or extended XE RAM banking in order to be able to read and reply to messages using the QUICK message format and an offline reader. The TEXTPRO editor is quite capable of generating the control characters and fixed length records necessary to be compatible with the QUICK message packet format. Compiled BASIC is not really a necessary requirement. (In fact, the format of a QUICK packet is so simple that I am surprised that there are not FORTH, C, PILOT, LOGO, and ACTION! programs written that will generate QWIK message packets. Well, good luck with your trials of off-line message readers! I hope that you may find a solution that works for you....

P.S. (Someone in charge of the Archive should slip a note into the QWK-SILVER first release stating that two drives are required to run the program. Thanks!)

>in the credits-- but Star Raiders II == the Last Starfighter? An
>interesting assertion, but I remain skeptical...

Don't be too skeptical-- I've had the 'Last Star Fighter' for years and
have found it to very a very playable game. It is true that it lacks
some positive similarity to the movie, but then how well could they
have made a 'port' from that movie. It better they didn't try and
copy the movie themes verbatium, cause it usually dosn't work out-
i.e. try playing E.T.- it sucks!

I was laughing hard when they intorduced the "star raiders II'
and it was the same exact game that had been out for a long
while as Last Starfighter. Pretty lame, atari!

It's still a very good game regardless..IMHO!

Wasn't Star Raiders II first released as "The Last Starfighter, " by a different software company? I thought that was pretty amusing. Atari must have spotted the game and snatched it up as SRII.

It'll never touch SRI, though. As soon as my new copy of SRI arrives in the mail... Ohboy oh boy.. :)

|>

About 6 months ago I posted here, on GEnie, and CIS about the possibility of doing this. About six people responded positively. Here's some of my thoughts:

- rather cheap (<$100) external fax/modems are now available
- a terminal program could be written to interface these, or an existing program could be modified
- source data for sending could be generated with something like Daisy Dot, Print Shop, Page Designer, etc., as long as the output could be directed to a file containing the dot-addressable graphics
- faxes being received would probably have to go directly to hard disk or RAM disk, as they are potentially huge (470K or so, depending on how much the compression buys you) and you would like to limit transmission time
- received faxes could possibly be viewed at either greatly reduced resolution, or with a smooth-scrolling multi-page viewer (again, only with hard or RAM disks)
- received faxes could be printed via 24-pin dot-matrix printer using another program
- remember you'd have to leave your 8-bit turned on, ready to receive faxes all the time (unless you always had the person call you voice, then switch to fax)

All this points to quite a lot of work, and a good 6-10 months of time developing it. I have collected a bunch of stuff on the subject (but have not plunked down $200+ for the official documentation) and will admit it is possible. It would be easiest if someone chose a brand and model of fax/modem up front, as every model would probably react differently. So once again, I ask, is this worth spending time to develop?

How different is the shortwave weatherfax standard from telephone faxes?
If it's not much a place to start may be with the article in some fall
'86 ANTIC on decoding weatherfax transmissions. There were also some
more technical articles in BYTE on that topic somewhat previous to that;
I think they may have been Apple II based, not sure. At the very least
the ANTIC article would give a starting place for some software
ideas. A high-speed modem (>2400 baud) has been on my wish list for
a while now. Since most of these are fax capable, being able to use
all the capabilities of one when I do get one would be really nice.
I'd say it's worth it; the 8-bits desperately need support for modern
peripherals. I may be able to help on such a project during the summer
when I'll have more $$$ and free time but I don't know how good my net

> That's why you get a different number of little squares for the self-test
> with and w/o BASIC.

The original post implied that holding down OPTION gives you access to 64K
RAM on the Atari 800XL. It does not. It disables the BASIC ROMs, as you
say, but this only gives you access to 48K, not all 64K.

In fact, the Atari 800XL really only has 62K RAM, since 2K of it is
reserved for I/O address space. Accessing all 62K of RAM requires that
the application program specifically twiddle bits in $D201 (the address
may be incorrect; it's been years. It might be $D20A, or $D40E. Argh,
and I thought I'd always remember those hex addresses.).

Well, that's it, final program for transfering from a stock
1050<=>IBM. I wrote it & left it set up for my system with a
stock 1050 as drive #2 & a D9: ramdisk
Re: Dr. Jolts
I didn't see your post in the net, but I got your E-mail. I tried
a little while with a XF551 years ago, but failed to work on it
more then a few minutes. The XF is such an odd beasty & I'm not
sure how IBM lays out it's sectors for double density double
sided disk. Matter of fact, I tried using a 360k disk with a
stock 1050 this time & it didn't seem to aggree with the IBM
after sector 50 or so. For MS DOS 5.0 >FORMAT A:/F:180 was the
only thing I did once it worked. About a XF551, I like the
drives, but they are not real smart. A "normal" Atari drive
determines the disk density when you close the door. An XF just
tries in the density of it's last successful read, then flops
around trying whatever else it can. Punch line is I have no idea
what it settles down to after the first shot at an IBM style
disk, so I don't know if it settles on [18, 26] sectors/track,
[128, 256] bytes/sector [single sided, double sided] or what. I
don't have a stock XF to try it out on. It's a REAL easy call
from Action! to interogate the drive & set them to whatever
their capable of doing. If you'd like to see it, I could post it
in the net or E-mail. I've also got the MS .EXE files on the
clone with a UUE coder if you need it.

Star Raiders II was definitely going to be 'The Last Starfighter'. Beta copies exist; this had an animated title sequence which Star Raiders II is missing.

A local station ran the movie itself a few days ago. The command ship looked just like it did on the game! Wow... only us 8-bitters would pick that up.

Jeff_M_Lodoen@cup.portal.com

998. Atari 850 power specs

Newsgroup: comp.sys.atari.8bit

I wouldnt say "only used by a few".. I'm sure pretty much EVERYTHING
outta Europe nowadays takes advantage of the hidden (under OS) RAM.

In a previous article, msteve@magnus.acs.ohio-state.edu (Michael Steve) says:

>
>I am also interested in this, a vt100 emulator for the 8-bit. please send this
>information too if possible.

From the FAQ List (which I posted merely 4 days ago):

What are the best telecommunications programs available for the 8-bit
Atari?
It all depends on what type of computer you intend to connect
to. For
connecting to Bulletin Board Systems, BobTerm is the unchallenged favorite.
For connecting to larger computers, you will need a VT100 emulator.
Severalare available for the 8-bit Atari, each with its own advantages.
Kermit-65 is
a VT100 emulator, provides Kermit file transfer and an 80-column screen
display, but does not support the XEP80. VT850 is a VT100 emulator that
supports the XEP80 but provides no file-transfer. OmniCom is a VT100
emulatorproviding both kermit and xmodem file transfers, plus an 80-column
display, but
does not support the XEP80. Each of these programs is known to work with
the
SX212 Modem connected to the SIO port, and to work under SpartaDOS and
MYDOS;
each program is available at the atari.archive.

[Sorry for the lowsy formatting, the reasons are too obscure to bother
explaining.]

Source record: 107461

I remember back when I had my Atari 130xe, a terminal program called 1030 Express and 850 Express were WILDLY popular. What happened to them? What other programs did the programmer for the Express series write?

On a different note...are the pirate Atari 8-bit BBS's in Maryland and BBS's (all pirated). One BBS in particular, received new pirated games daily before they were even released (they also had all 5200 games hacked to run on 8-bits, like Gremlins). Chugging along at 300 baud with my 1030 modem used to download those huge (for an Atari) files that took almost two hours to download...

The author of the Express! series is Keith Ledbetter. He used to do programming for ICD(Innovative Computing Design), the producer of the P: R: Connection. I believe that the first one of the Express! series was ASCII Express! for either the Apple, or the PC's. He also is the outhor of the (once) popular BBS Express! Bulliten Board host program. Good software. And then went on to an ST Express! for the ST series. I do remember that he had a little tizzy fit with the folks at either Atari, or at ICD, and then was nicknamed "Keith Bedwetter", and has since dissappeared from site. Does anyone know what he is up to? Also Keith, if you are reading this, that bedwetter comment isn't of my origin, but just what I saw when seeing a post that had anything to do with something associated with you, :). If you are alive, tell us what's goin' on with ya!

1004. Brand new Atari 7800 game system for sale

Hello everyone,

My name has been in a number of posts saying that I bought the last Atari 7800 game system from US Telegames. This is true. However, I was able to buy a used system for a bit cheaper from a swap meet. I payed $50 + $5 shipping for the new system which includes two controllers, the console, power adapter, TV switcher, and Pole Position II. Of course, it's in its original box and original packing. I would like to sell it for what I paid. I will sell it to the first person who offers $55 total. If I don't get that, I'll sell for best offer. I'll answer every message so everyone knows where he/she stands in terms of the highest offer.

Please e-mail

Thanks

Tom
tomcat@leland.stanford.edu

P.S. I would consider trying to negotiate a trade for an Atari 5200 system

>-Eyvind
>
>[...rather offensive sig deleted...]

Actually, the OPTION button has nothing to do with the upper 16K in an 800XL. When you boot the system, holding OPTION simply tells PORTB of the PIA to map memory into RAM and not BASIC or a CART. The upper 16k of ram is mapped into the same area as the OS and any application using this RAM must bank select appropriately or supply its own OS routines. SpartaDOS X is probably the best example of using PORTB to do great things with bank switching.... Anyway... Just because you hold down OPTION does not mean that the program requires all 64k.

Hello everyone, I've finally acquired my Atari 2600 system. I have several questions about some of the games. I'm hoping some people know the answers to them.

1. In Tron Deadly Discs, what is the point of shooting the boxes around the border of the screen? You shoot them, and they turn color.

2. What are the Atari 5200 and 7800 systems? I remember seeing one of them years ago, I think it came with Pole Position II. I've heard that someone actually sells the 7800 still. Who sells it, and how much is it?

3. What is the point of Swordquest, Earthworld?

I'm also looking to buy Atari 2600 cartridges, If you have any to sell, send me Email with what you have, and how much you want. I'm also looking for an Odyssey 2 system, an Intellivision system and a Vetrex(sp?). If you got one icking around, let me know. Thanks,
Brian Lasko

> Thanks for any info on this.
>

*Yes! (As you can see, I'm replying to this message offline on my XL.)
Newer versions of PabQwk and QWKSilver have been released (1.1 &
0.21). Version 1.0 of PabQwk seems to be a very good program, but was
very hardware specific, requiring a 130XE or upgraded XL very, very
compatible with the XE. (Rambo XL's do not cut it, I know, I tried.) I
think 1.1 is not as hardware specific, but as of yet, have not
tried it.
*
*QWKSilver 0.20 had some bugs that really prevented it from being used
effectively. It would always look for D2:, even though you didn't have
one, or not have it declared in QwkSilver setup. Also, it wasn't
(and still isn't) compatible with SpartaDOS, but hopefully that
situtation will be remedied in the future. Ver. 0.21 corrects the major
bugs in 0.20, but the DOS you use (2.5, MYDos, etc.) must be modified
to allow 4 files open at the same time. I have had no problems with
0.21.

*Hope this helps!

>the mail... Ohboy

I have both The Last Starfighter and Star Raiders II, and
they indeed are very similar, but there are some differences also. I seem to remember there was something about a force screen in the movie, and there is something about that in the game as well. I also think there may have been a mega-ship in TLS but not in SRII.

I may have to pull them out and play them again.

Yes, I've seen that article. The old WEFAX transmissions are not the same as the current Group 3 fax standard, where pixels are sent with digital compression, rather than an analog signal. I have read the BYTE article, which was very good.

Most of the work would be the time-consuming trial-and-error debugging of the terminal program, figuring out why the receiving fax machine isn't responding, etc. If someone can loan me both a fax machine and an external fax/modem for about a year, I'd consider it :^)

>
>Star Raiders II was definitely going to be 'The Last Starfighter'. Beta
>copies exist; this had an animated title sequence which Star Raiders II
>is missing.
>
>A local station ran the movie itself a few days ago. The command ship looked
>just like it did on the game! Wow... only us 8-bitters would pick that up.

Okay, what have I got here then? I have a 'bootleg' copy of
'THE LAST STARFIGHTER cracked by NEIL AND BRUCE?' anyways,
needless to say I had this program a VERY VERY long time before it
was released to the public, and under the name SRII.

The beginning animated sequence is the SAME as in the movie with the
same looking ship taking off from the same looking platform at the beginning
of the game that was shown in the film. It even has that neato story
line at the top scrolling by and the same music as from the movie.

The graphics and concepts are very similiar to those in the film when
it comes to the bad guys tunneling thru the barrier.

Someone here said that SRII was much more playable? What does that mean?
that graphics in this game are spectacular. I, however, will always
love SRI and I must say this: there are even MSDOS abusers who love it
and can't believe its only 8k.

As I said, cheep.
I have a 1200XL that I hardly used ever, and I don't feel like
moving it to Colorado with me.

1200XL little use
1050 floppy " "
1020 color plotter never used
BASIC, whatever manuals and floppies I can find, 2 power
supplies, maybe some joysticks (I still have to search for some
stuff).

All this for (hold yer breath)... $30.00
If you can convince me that you are a charitable organization,
i.e. a elementary school, not just poor or cheap, then you can get it
for the special bargain rate of free.
Everything worked fine when last used, I'm just tired of dragging it
around (yes, I have a 486-33 peecee to play on).

>interesting assertion, but I remain skeptical...

A good time before Star Raiders II was released, some pirate pals of mine showed me a copy of the Last Starfighter game. Although there are difference, both games are the same. I guess Atari canned the Last Starfighter game for some unknown reason and then decide dto redo it a bit release it as Star Raiders II....

1028. Black Box Cheats II

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-09 18:55:38 UTC
From: alj@bilver.uucp
Message-ID: <1993Apr9.185538.27745@bilver.uucp>
Source record: 107490

```
The Black Box Cheat List II
---------------------------

After purchasing a Black Box, I quickly realized it could help me
breathe new life into some old games that I gave up on because they were
too difficult or didn't quite work the way I wanted. How? By entering
the 6502 monitor and messing around a bit with memory, you can produce
some wonderful results with many programs, mostly greatly extending how
many lives you have. I've compiled a list of programs I've bothered to,
shall we say, "fix". They are listed below, along with some comments on
what you are actually doing. Have fun and if anyone else has done this
with other programs, feel free to post your modifications!
! Note ! Since there were many different versions and formats of the
programs I will describe, these cheats may not work with what you have.
In fact, it's possible they may be damaging to your system. Therefore,
please write-protect your hard drive, remove the disks and take whatever
precautions you can to ensure that if your computer goes blammo nothing
that a simple reset won't fix will occur. Be careful!
To use this information, make sure you have a Black Box. Next, load
the game. Select whatever options you want and then start the game.
Press the left black button on your Black Box to get your menu of
options. Choose <C>, the 6502 Monitor. When told to place a value at
a certain memory location, type an "*" followed by a space, the
memory location and then press RETURN. For example:
* D01D <Press RETURN>
Next, type a "D" then a space and the desired value finished with a
RETURN, like so:
D 3 <Press RETURN>
When you are finished poking around with memory, press the ESCAPE
key twice, once to get to the menu and another to return you to your
program.
As a special note, the Black Box tries to restore you to exactly how
you were upon entering it. However, it cannot retrieve your player-missile
graphics, as it has no way of knowing whether or not they were on when
you were in the program. Therefore, deposit the value of three (3) into
location $D01D just before pressing Escape twice to get back to your game.
This will restore the graphics, although they might just look like screen-
length lines when you are still in the monitor mode. This step may also
not be necessary for all games (those that don't use PM graphics).
Feel free to drop me a line at my electronic addresses at the end of
this post if you have any questions or comments!
**********
Gateway to Apshai For infinite lives, place three NOP's ($EA) at $8D9E.
----------------- For unlimited health, do two NOP's at $A519. To keep
```

DISK your Luck from being reduced, five NOP's at $82BA will
do the trick. To help keep your Strength from dropping,
cram five NOP's at $82BF.

Phantasie Your statistics start at $B301 and go through $B306. To max
--------- them out, place $16161616160D there. Your HP are at $B30A/B
DISK and your MP at $B30C/D. To max them, try $FFFF7F7F. Your
spells start at $B33D - one byte per spell, a one means you
know it. Two of your skills are at $B326 and $B322. Your $
in hand is at $B7AF. The number of items you are carrying is
located at $B397, followed by the item numbers themselves. If
you would like to walk through valid dungeon walls, place two
NOP's at $523B when you are in the dungeon (the game reloads
the program every time you enter/exit). Your Race is in $B3A1
and your Class in $B397. Notice all the character locations
are for the first player (I only used one to win the game).

Temple o' Apshai Trilogy For 100% Wounds (and Fatigue), place three NOP's

Uncle Fester,

The XF551 does not do true Ultraspeed.
The XF551 has density sensing problems, many times I have lost my RAMdisk
on my 1088K machine because the drive had problems reading the boot disk,
SD-X gave up, and defaulted to that STUPID 130XE ramdisk, which wipes out
my 960K ramdisk configuration.

I never thought there could be that much improvement, until I installed
the single drive upgrade in the XF551 controller card that resides in my
1200XLD. I felt like man has just learned to walk erect. The difference
in speed is quite dramatic, and now I want single drive upgrades
for both of my other XF551 drives. Also, you cannot format the flippy
side of a 5.25" disk, because of the timing hole. You need the XF551 enhancer
for that, and the update to remedy the two other problems.

Jeff

Keith Ledbetter wasn't the author of ASCII Express; the company credited with
AE was Southwestern Data Systems. AE was a GREAT program, lots of hardware s
support, but terrible file transfer abilities.

Ledbetter is writing MS-DOS programs, like LCD and SST, which are largely
tools that do neat stuff but can ultimately live without.

I remember Ledbetter writing the following:
1030 Express, MPP Express, 850 Express, BBS Express, and a few spinoff products from the
other ones.

I think he also did some utilities for ICD, if I'm not mistaken.

>via the serial port.

Two ideas:

1) Is the R: handler loaded? You should append the k65.com file to an SX
R: handler, like sx212a.arc on the Archive (which is what I use).

2) Is BASIC enabled? K-65 won't work with BASIC taking up memory.

You might want to check out Phantasie I/II Editor. It enables you to do marvalous things with your characters - including editing your inventory score, age, skills, spells. Anything you culd possibly want to do.
I'm not sure where the copies are floating around at, but if you want, I can dig it out of my archive and ftp it to the Archive at UMich.

-Craig Lisowsk clisowsk@mcs.kent.edu

BTW: I'm also the co-author of the above mentioned code.

1040. Article reposting failed: `Patch for Atariwriter 80 ' (fwd)

Subject: Patch for Atariwriter 80
Reply-To: jjmcwill@mathlab.mtu.edu (Jeffrey J. McWilliams)
References:
Organization: Case Western Reserve University, Cleveland, OH (USA)

I used a post from Joe Sabatino for the basis of a modification for
Atariwriter 80. From the name at the bottom of the posted article,
AWP2DOS originated from a guy by the name of George King.
Instead of telling AW80 to run XON2.COM or X32D.DOS, I created a little
file called DO.OBJ which just does a RESET. That way, you don't do
a coldstart when you exit AW80, you end up back at the command prompt.
It works with 3.2d, I haven't tried whe modification with Sparta-X
yet. What I plan on doing is making DO.OBJ give you the choice of
running MM.OBJ, exiting to DOS, or getting directories of D1-D9.

What I was wondering was this: Ben Poehland mentioned that LVAUG or somebody
did a different patch for AW PLUS that made it compatible with Sparta 3.2d.
Can somebody give me that patch? I would like to see if similar code
can be placed into Atariwriter 80.

In a previous article, thester@nyx.cs.du.edu (Uncle Fester) says:

>
> I have an original XF551. What are these bugs you speak of?
> I haven't run across any in the several years that I've had it.
>
> Uncle Fester
>
>--
Uncle Fester,

The XF551 does not do true Ultraspeed.
The XF551 has density sensing problems, many times I have lost my RAMdisk
on my 1088K machine because the drive had problems reading the boot disk,
SD-X gave up, and defaulted to that STUPID 130XE ramdisk, which wipes out
my 960K ramdisk configuration.

I never thought there could be that much improvement, until I installed
the single drive upgrade in the XF551 controller card that resides in my
1200XLD. I felt like man has just learned to walk erect. The difference
in speed is quite dramatic, and now I want single drive upgrades
for both of my other XF551 drives. Also, you cannot format the flippy
side of a 5.25" disk, because of the timing hole. You need the XF551 enhancer
for that, and the update to remedy the two other problems.

There --IS-- a two position switch between the "switchbox" and the "power in" port on an 800XL. What this switch does is to select T.V. channel 2, or T.V. channel 3, as the channel to turn your T.V. to when using an R.F. modulator. If you are using the monitor port, and are not using an R.F. modulator and T.V. switchbox, then changing the position of this switch will have no effect. There is no toggle switch between the "switchbox" and the "monitor" ports on a standard "stock" ATARI 800XL (that I could find). Good Luck!

1046. 1200XL fer sale

Message-ID: <1993Apr12.090231.15095@wattres.SJ.CA.US>
Source record: 107502

Followup....
Apparently my offer for a 1200XL and a 1050 drive for $30 is a
bargain, based on the volume of offers received.

Difficulty- I was unable to locate the power supplies,
manuals, etc before leaving for Colorado tomorrow morning. So the
offer is still good for the hardware I have, plus I will relinquish
the other stuff as soon as I can get back and find it (this could be
several months).
So if you're *still* interested, try mailing again. I know it
sounds like a cheezy deal, but that's unfortunately the way things
worked out. I won't be able to respond to all inquiries personally,
but somebody will get the box.
Thx!

I could never figure out why so many 8-bit owners are apparently so anxious
to turn their XF551s into non-double-sided drives. Why not just use it as
a true double-sided drive (under Sparta)?

I can't speak for everybody, but I had my XF go out with about 1/2 of my source code files for various projects stored on it in 720k format on 3.5" & quad 5.25" disk. Took me for ever to get the stuff retrieved. The only bright side was I also bought an ATR 8000 which can also drive the higher capacity drives. I'm still a little leary of putting stuff on the high capacity DS drives just because I know I'll never be able to recover side 2 if something goes wrong. I don't spend that much time programming, but if I have 100 hours worth of source code on a disk that I can't access, that's about two months worth of weekends that have gone. 905 of the xf's I've seen still go for about $100 (90%). I don't know if I'd want to spend that much just to keep programming the 8 bit with a 360k drive. There's also games like AR & Ultima which require you to make copies of the original data disks & character disk. Since the xf won't do side 2, you would end up with your 3 original disk + 4 data disk + a couple of single sided character disk just to play the game. Damm inconvienient.

Steve,

Because there are still people out there with single sided drives using
flippies, and there are times when I find time to send programs to folks
who request them, and when I do so, I'd like to format flippies instead of
wasting extra diskettes 'cause a stock XF551 can't create a flippy and
a 1050/810/Indus GT/Rana 1000/Astra/Trak drive can't read true double
sided disks.

A few weeks back, I got a avatek modem and 850 interface from
somebody. I hooked it up and ran the bobterm program that person
gave me. After it loaded up, it gave some kind of error :
MODEM HANDLER NOT LOADED
or something like that. Evidently, I must be missing some file.
Could someone tell me what files are absolutely necessary to
make bobterm run properly.
And also, the avatek modem had no instruction manual. I don't
know what model it is right now but it is very compact and yellow
in color and can do 300/1200 baud I believe. What I need is the
instruction manual. If that is not possible, could someone tell me
what the dip switches and lights on the front mean so I can set
them properly.
Thanks for your help

I just got the Omnicom working. Though I am using a stock 800xl
with 64k I think my report will Be helpful.
****
1. I donot have much $$$$$$$$ to spend on hardware so I wanted
a stand alone term program with 80 colums
2. I was using the latest version of Ansiterm 1.0 But I had a
few minor proBelms with it when on a unix system such as this
one. (i.e., displaying menus twice)
3. So I finnaly figured out how to run Omnicom and so far so good.
4. So far I find it works Best on Mydos rather than Spartados 3.2.
5. Figuering out how to dial out was an adventure cuz the info for
that wasn't in my docs. You dial directly from the key Board or
By using macros. You need to refer to the modem dialing comands
for the proper dialing codes.
++++++++++
I don't know if 800xl is incompataBle with the 130xe But i think
you should try omnicom if you donot have or cannot afford the extra
hardware such as an 850 .

That's not the point, tho. He's talking about the fact that the XL/XEs
allow the OS, not just BASIC, but the entire OS to be swapped out for RAM
use! My 1200xl doesnt have built in BASIC, just like the 400/800s, so
>I< dont need to hold down [option], but I can still run XL/XE stuff that
CANT run on 400/800.

Got it?

Message-ID: <C5Es7A.G97@bunyip.cc.uq.oz.au>
Source record: 107364
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I have been trying to use alchemy junior as a sequencer on my
JV-30 (Roland) but have been having trouble. The sequencer will
happily play on the keyboard, the prerecorded songs work well as
does the click track. When I record as segment and drag it to a track
it always thinks there are zero events (although all the events actually
are there when observed in the patch diagram). I know I am supposed to
double click on the pattern to set a new pattern to paste the track into
but the double click never does anything. The result of this is playback never
produces any sound from the keyboard!

I know the atari is OK because 32track records and plays back properly,
it however doesn't handle patterns; my primary use is for a rhythm recorder?

The atari is and st with 4 megs, any help would be greatly appreciated!

Thanks Colin Canfield

The "R:" modem device should be loaded straight from the ATARI 850 interface ROMs, itself. No modem handler should be necessary. The ATARI 850 interface should drive the AVATEX directly. Make sure that you turn on your ATARI 850 INTERFACE --BEFORE-- you turn on your computer. When you turn on your ATARI computer, you should hear a one second "BELL" tone before the disk drive starts spinning. This "bell" (provided that you have your audio leads connected and SIO sound enabled) tone indicates that the "R:" device handler is being loaded from the ATARI 850 INTERFACE and is installing itself into your device handler table. Good Luck.

I have a 130XE witha 1050 disk drive that i plan on using for my music studio
along with some other 8 bit machines and my ST. I have tons of software for
the XE since at one time it was the computer I used. The point is, i am at
college several states away from home where all the stuff is but would like
to generate some interest in it before I go home away from my account. I had
a lot of fun with the software and magazines and would really like them to go
to people who still use their 8 bits in that capacity. Its good software, too,
with docs and boxes for the most part. Some of the magazines have disks and
of course are full of great tidbits and programs.
What I propose is that if you would like me to mail you a list of stuff this
summer when i go home, just send me your address via email. I will compile
a list when i get home and mail a copy to each address (I may require some
help on the postage, like an SASE or something depends on how many people)
Well, thats that. Glad to see so many people still enjoying their 8 bits. They
are great machines.

Message-ID: <kZ2y2B1w165w@cyberden.sf.ca.us>
Source record: 107383

Geez. My TurboBASIC XL program that I made with the help of... oh, who was it? Someone into digitized sound (this was a while ago.. point yourself out if you like :)).

Anyways, a friend of mine had gotten a bunch of sound effects and gave me a few. I had him convert them to Raw 8bit format so that the conversion would take little time. Anyways, I was going to use ASSC, the "Atari Sampled Sound Converter" (may have got the "S"s mixed up), but it didnt work! It ended up creating a 3 sector "4bit raw" file out of a 200+ sector 8bit raw file! (I didn't do a directory first, duh, I just loaded up the player right away and found out "the hard way" that it didn't convert properly).

ANYways, I've come to find out that MY little whimpy and slow TurboBASIC XL program, Convert 8->4, works better than this supposedly "great" program! So, what's the deal with ASSS? (last "S" in this case meaning "System") Is there a new version out there somewhere? Of course, as long as I'll always have a way of converting some of the compressed and strange format sound files to Raw 8bit, I won't really NEED one, but who knows when my friend'll up and die? No, just kidding.

Anyways.... I was just wondering.

Maybe I'll upload it and my "better" "LOADPLAY.LST" (which comes on the Parrot Disk.. mine loads not just "Structured" (multi-sound and formatted) files, but also "unstructured" (the raw type, that you make first with the sample program)) to the archive when I get my IO ports working! <cry>

Well, my useless post for the week :) ..

Awhile ago, I posted a message about various games, as well as asking if anyone had an Odyssey 2 or Intellivision system lying around. Someone (sorry, can't remember who) replied saying that they had an Odyssey 2 and ten games they'd be willing to sell me. Anyway, I replied back to you, but haven't received any reply yet. If you got my reply, and just haven't gotten back to me yet, fine, I'm just asking as I believe they're been some problems with our Emailing lately. If you didn't get it, I was wondering what games you had for the odyssey, and a just a general list of everything you wanted to sell. thanks,
Brian Lasko

1065. 1 Meg MIO from ICD. Does anyone know the part numbers for SCSI?

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-14 03:14:27 UTC
From: steibel@cs.umbc.edu
Message-ID: <1qfvijINNjvm@venus.cs.umbc.edu>
Source record: 107375

Hello,

I own a 1 Megabyte MIO from ICD which I have attached to an atari
800xl. I would like to hook SCSI devices up to it. Does anyone have
a list of hardware that I could purchase cheaply to hook up a small
SCSI harddrive?

I do have the manual (a sheaf of stapled papers) and I have access to
all of the major computer magazines although telephone numbers, part
numbers, and prices is all I am looking for.

Thanks,

Source record: 107388

Well, unless there's ANOTHER switch called "channel", then this one is
the channel selector for your RF. You can select either channel 2 or 3.
It doesn't effect the monitor output, of course.

If there IS another called "channel", then this COULD be an OS switcher.
On my new 1200xl motherboard, Bob Woolley had replaced the 1200xl OS with
the older 800 OS and the newer 800XL OS and used the channel selector as
the switched (I didn't like it too much....altho I use the monitor port
MOSTLY, I do have uses for the RF-TV port).

THere yago!

Your grey only screen could be either a problem with the video or TV output, OR simply a "twisted too far" hue knob on the inside. If the 800XL's anything like the 1200XL, there should be a little knob, usually with a hole above it in the sheilding, so you don't have to mess with the shielding. This controls the hue. (I've messed with mine too much lately! whaa!) Anyways, to get to MINE, without taking the shielding off, you need a flathead screwdriver. With the shielding off, you can simply turn it.

Again, this is on the 1200XL, and I'm ASSUMING (bad thing to do, Bill ehhe) that its similar on the 800XL.

Source record: 107390

Again, that switch can be either OS or channel selection!

Hook up the computer with an RF modulator up to a TV switched to channel 3. If it looks like hell, switch the swtich. If it looks like normal, switch the switch and it should end up looking like hell. ;)

A way to test what OS you have is this:

turn on computer (no [option]!) - will get the READY prompt.
type "BYE"

if you get to "ATARI COMPUTER MEMO PAD" you have it in 400/800 OS mode.
if you get to "SELF TEST" you have it in 800XL mode.

Switch the switch. It SHOULD crash the computer.

now reboot and do the same.

On most occasions, you'll want it in 800XL mode (the one with the SELF TEST). Some older games require the 800 OS tho, which is why it'd be there in the FIRST place! ;)

Welll.. have fun.. Enjoy!

(have I REPLIED enough or WHAT?! :))

1077. QUICK V2.1 now available in an English version

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-14 18:54:24 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1qhml0E3co@uni-erlangen.de>
Source record: 107386

We are happy to present QUICK, the new programming langauge for your ATARI
8 bit computer, now in an English version.

QUICK is a completely software based compiled language that is almost
as fast and powerful as assembler, but also very easy to program.

QUICK is a powerful language that has some unique features:
- automatic mouse control
- player/missile commands
- subroutines and local variables
- in-line assembler
- cut/paste for hi-res graphics (Blitter)
- command to play digitized sounds
- automatic VBI and DLI commands
- libraries for almost every task
- multitasking with additional libraries (not included)

QUICK gives you the ability to get the most out of your Classic
ATARI with little effort. To show you some of QUICK's unique capabilities,
we will post some QUICK demos to a.a.u.e called "QIKDEMOx.ARC"

The German or International (English) version is available from:

PPP
Postfach 1640
W-7518 Bretten
Germany

Price: DM 39 plus P&P

In GB and Ireland you can get QUICK directly from:

Dean Garraghty
62 Thomson Ave
Balby
Doncaster
DN4 0NU
England

UK PRICE: 16pounds including P&P

--
Harald Schoenfeld | I'm sorry Dave,

1078. New games available

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-14 18:57:58 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1qhmrmE3g9@uni-erlangen.de>
Source record: 107387

We are happy tp present some new games for the Classic ATARIs in an
english version:

MINESWEEPER

The classic game, that is well known on PC's and ST's is now available
for the 8 bit ATARIs. It has different levels, a high score table and
can be controlled by joystick or ST-mouse.

GLAGGS

Unfortunately ATARI never presented a version of Klax for the 8 bit
ATARIs, although it was a big success on the ST and Lynx. Here is our
program that is more than just a compensation.
Glaggs is one of the most colorful programs you ever have seen on any
8 bit ATARI.

Rubber Ball

Move a small rubber ball through the dangerous levels of an air conditioning
system. Perfect fine scrolling and digitized music are waiting for you.

All games are written in QUICK, the new programming language for your
8 bit computer (not a single machine code routine was used!).

To test the games you can look at the demos available at archive.umich.edu:
- QIKDEMO4.ARC is the demo of Minesweeper
- QIKDEMO5.ARC is a demo of Glaggs
- RUBBERBA.ARC is a demo of Rubberball

The German or International (English) versions of the games and QUICK
are available from:

PPP
Postfach 1640
W-7518 Bretten
Germany

In GB and Ireland you can get the games and QUICK directly from:

Dean Garraghty
62 Thomson Ave
Balby
Doncaster
DN4 0NU
England

Please note: Some of the games may not work on NTSC or 1200XL computers. Try the demos and tell me the results, please.

Harald Schoenfeld | I'm sorry Dave,
(mppi76@cd4680fs.rrze.uni-erlangen.dbp.de) | I'm afraid I can't do that.

1079. Connecting two computers

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-14 20:01:35 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <cTi12B1w165w@cyberden.sf.ca.us>
Source record: 107392

WHat exactly is the cheapest, easiest, most conv convenient way to connect two 8bits together? Ie, for playing head to head games (ala GameLink... dont know where to find it tho!), or sending SMALL amounts of data (perhaps 2-4 bytes at a time).... NOT a Mux! ... perhaps that SIO thing Jeff Potter was working on (ala ST's Midi Maze, but for 8bits).

Anyways, I've had this idea of using duel CPUs for games (one for game/graphics, the other for sound and music)

<damn this line noise!>

Anyways.... I tried stick port -> stick port, but I guess I overlooked SOMETHING, or maybe I just don't understand how it's done.. What I did was connect

computer 1 port a -> computer 2 port b
and
computer 2 port a -> computer 1 port b

with stick cables, and I DID have the bits set up for I/O properly, but it just didn't work!

(btw: when I say "port <letter>", I really mean "port <number>"... I'm trying at the moment to connect two 1200xls, they only have 2 joystick ports, the PORTA selection... you know all about the PORTB and ...nevermind... I haveta run in a sec ;))

ANYWAYS... HOW DO I DO IT!? Computer one's output didn't get "heard" by computer 2 and vice versa.....

This is not at all as simple as I first thought :(

Anyone? Anyone? Suggestions?

(btw: I even had the thought running around my head to simply "install" a second, small, motherboard (would take HELLa hacking!) with it's own RAM, CPU, and sound chips... nothing else... just a small "sound processor".. Of course, simply connected a port, even 4 bits (would do!, as long as I can send them in packs to make bytes, perhaps..?!), would be SOOO much simpler.

I know plenty of people have 2 computers....

(I mean, CAD XE, ChromaCAD XE, and plenty of other stuff REQUIRE extra RAM, and there have been enough people out there with it with the RAM to use them..... get the picture?)

Well.. bye!

(the above was NOT one of my better posts :) Maybe I'm just desperate?)

Something else I also thought about. Aren't there versions of
Kermit out there that already have the 850 handler appended to it?
Seems to me I recall something like that. That could be the problem.

Also, if you use something like SpartaDOS, you can set everything up
in a batch file, first loading the handler, then loading the program.
Seems to work great for me...

Steve,

Well, that would be nice, except that I don't own 1050 drives, just XF551s.
Cheaper to upgrade an XF551 (probably) than to purchase a doubled 1050.

Hello folks,

I am looking for software packers for the the ATARI XL/XE. I have ARC and
UNARC by R. Puff, but it is not the best one.

Is there a version of LHA or ARJ or even a compatible packer and where
can I get it?

Replies please to flups@eurom.rhein-main.de...

Thanks

1090. April AC: Somewhat Delayed, Now On the Way!

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-15 22:18:21 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9304152109.AA26016@smithkline.com>
Source record: 107400

Hello Peoples,

I been keeping kindov a low profile the past several weeks but wanted to let everyone know that despite a variety of difficulties the April AC is now in the mail. The main hangup was that it got delayed at the printer for about 3 weeks. All the editing & DTP stuff was done in reasonably good time during the month of March, but everything came to a screeching halt when our Publisher sent it on to the printer. I'm now informed all the copies are printed up, were delivered several days ago to the mailer, & it's pretty well posted by today.

As most of you know, today is also Income Tax Day, so in all probability the April AC- being scumbag dirtball 3rd class bulk mail- will be allowed to sit on the floor of most local post offices while they hustle to deliver all those precious tax returns to the Infernal Revenooers at the U.S. Guvermint. Not that 3rd class bulk is real fast to begin with, but with tax returns in the way it will likely be even slower than the usual slow. By my reckoning, we'll be doing well to see it appear in mailboxes by the week of the 30th. We'll just have to live with that, there are some things I got no control over.

Although subscription orders are still dribbling in, AC is still under-subscribed. The April AC went out to around 440 paid subscribers, & presently I'd say our total base is around 460. Still not quite up to the 500 we need to really make significant improvements.

The good news is that I've now decided we are close enough to our original goal that we will publish 6 full issues this year. However, this late in our publishing schedule with under 500 paid subs, certain things are pretty well cast in stone. We'll still be stuck at 32 pages, no fancy covers, & good ole' 3rd class bulk mail delivery (aka Pack Mule Express). There is some faint hope we could still go to 2nd class delivery late this year, but not until we reach 500 subscribers. It will be june or July before we get there (at the present rate of growth), then another 2 months to get the permit, if we're lucky we'll have it in time for the Oct. or Dec. issue.

About 15% of AC's readers are outside North America, & most of them had the good sense to pay for the airmail option. So people in Germany & New Zealand will probably get their mags before we in the USA/Canada do. It's a weird world.

The June issue of AC is now in production & will lack a Swap 'n' Shop column since no one is sending in ads any more. (Can't figure that, the ads are after all FREE.)

Atari magazines in general are fairing poorly. Current Notes has reduced its page count from 82 to 64 & eliminated its usergroup discount but is still maintaining a steady publishing schedule & a decent amount of 8-bit stuff

tho it's still 80% ST. Atari Interface Magazine appeared in March for the first time since October of last year, but compared to a year ago it's a skeleton of its former self being 32 pages on newsprint in B&W & now bimonthly instead of monthly, but still a few 8-bit articles in there. ATARI CLASSICS is still hanging in there but overall subscription growth is substantially less than the market survey of 1992 suggested.

We 8-bitters at least have one advantage RE: our ST brethren: we have already been pushed over the cliff onto the computer junkpile, those of us still clinging to the 8-bit have no illusions as to our future, especially since Atari Corp. officially booted our butts out into the cold at the beginning

of last year & ICD did likewise. Whereas, for the ST community, the downward slide is a new experience, & they're just now getting a taste of what we began to experience since around 1989 or so. Atari Corp.'s delay of delivering the Falcon is I think setting new records for paranoia/anxiety/depression in the larger community. An article in the March AIM entitled "Atari Is Dead" was especially illustrative, as I think that author dared to say out loud what a lot of people have been privately thinking but won't admit publicly.

Whew, I sure am glad I'm an 8-bitter & have already passed thru all this depressing stuff. My main anxiety is getting out the June AC on time, plus our June Software Disk. That's plenty enough for me to worry about, as it takes 120% of my spare time.

1091. Using an Atari 8bit connected to a 2600

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-15 22:31:29 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1993Apr15.173129.17195@miavx1.acs.muohio.edu>
Source record: 107407

I was going through some old Radio Electronics (? I can't remember the name now. It's the magazine that had plans to build a lot of cool electronic stuff.) Anyway, they had a series of articles that would allow you to copy your 2600 carts to tape. (Why you would want to, I don't really know. It seems that the only real use would be to pirate games!!)

Anyway, what the project boiled down to was building a Z80 based computer with a cassette interface. After you copied the carts to tape, you plug a cable from Z80 into the cartridge port on the 2600, and loaded the tape into the Z80's memory, and then turned on the 2600. It saw the ram on the Z80 as a cart! Kinda cool.

What I would like to know is if it would be possible to do the exact same thing with a Atari? It already has the cartridge port that is a direct access to 16K, which should be plenty. What I would think that would work is to build a cable that would connect the 2600 and the 8bit by the cartridge port, you then load a 2600 game into the same location as the cartridge port, and then fire up the 2600. Would this work?

(My ultimate goal would be to build an arcade cabinet, but the 2600 and 8bit in it, use the 8bit as a menu system to play all the 2600 games. Use the joystick ports on the 8bit to switch between the output of the video of the 2600 and 8bit)

1094. Music with TurboBASIC XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-16 00:37:24 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <29P32B1w165w@cyberden.sf.ca.us>
Source record: 107402

Well, I've gotten the program "sound commander" to work with TurboBASIC XL
(I typed it in from some magazine, I forget which now!), but my problems
are:

it crashes after running an APAC routine I have (ugh! .. I guess they
don't like each other!?.. I'm not using both at the same time,
either!)
its REALLy hard to write songs for it, and I'm no song writer as it is
:) ... its mainly really good for sound effects
I have some other music programs, one in BASIC (oh, what was it
called..?) Umm... "sound maching", I think. I think Marek
sent it to me... it runs ok in BASIC, but the dreaded TBXL
RAM management screws this program up, too!

Anyways. I KNOW there mUST be something good SOMEWHERE! I'd like to be
able to run it in straight TurboBASIC, and have it run in the background,
like sound commander and sound machine do....

thanx!

1095. Print Star 1.3

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-16 06:33:14 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <1993Apr16.063314.25157@cs.tulane.edu>
Source record: 107403

Print Star Version 1.3
By Tom Andrews - (c) 1992

Not that long ago someone was asking if a program similar to the MSDos Micro Text was available for the Atari 8bit. At the time I would have said, no however, little did I know Tom Andrews was beta testing the first versions of Print Star.

What is Print Star

Have you ever wanted to save paper while printing out those long doc's (Those of you who have printed out the TextPro Doc's know what I mean). Did you ever want an easy way to print on the front and back of your page? Well then Print Star maybe a program you want to look at.

Simply, Print Star will print to any Epson or Gemini 10x compatable printer in two or three columns, in one of three type sizes. The only restriction being that the original text file must be in 40 column format (Very easily done using TextPro). The program allows you to print either all pages, just the odd pages, or just the even page. Those of you following along see where this is heading. You can print all your odd pages first, turn the pages over and print all your even pages, saving a load of paper. You can print in either continuous, continuous auto feed, or single sheet. Using the smallest print (superscript on your printer), Print Star can fit about 2.5 converted 80 column sheets per page. The author states that a 765k double density text file can be printed out on only 13 pages (front and back). Print Star even prints a double ht, double wide header and a standard size by line centered on either the first page or all pages, and there is even the option to print footers with page numbers.

The doc's are very clear and easy to follow, and are already in 40 column format, ready for you to print out using Print Star. I spoke with Tom on GEnie, and he really does want to hear from you. If you like the program, hate the program, or just have ideas to improve it, drop him a line. His address, GEnie Mail address and New York BBS where he can be found are included in the doc's.

Print Star is written in basic and can be compiled using the TBXL compiler. At this time the author has not set a shareware fee for his program but has released it as Freeware.

Print Star has been uploaded to the atari.archive.umich.edu under the name pstr13.arc and can be found in the atar/8bit/New directory.

1096. Undocumented Feature in "Mr.Do!"

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-16 09:34:38 UTC
From: etxansk@garbo.ericsson.se
Message-ID: <etxansk.734952878@garbod26>
Source record: 107404

I've noticed that there seems to be some unexpected "enemy" behaviour in Datasoft's adaption of "Mr.Do!" for the Atari computer. When the nasties are after Mr.Do, right when they're about to get him, it's possible to stop halfway through a chunk of the stuff he's digging, and the enemy stops too. It isn't possible to stay for too long, since the nasties tend to turn into something even nastier if they find out that the path ahead is blocked. But if the ball returns in time to save Mr.Do it's a great way to get out of the urgent situation.

I've assumed that the object detection logic in the Atari version of this excellent game fails at certain times, the nasties seem to believe that Mr.Do is an apple (sorry). Enemies stop at an apple and go mad the same way if they can't get around it.

Has anybody else noticed this? Was this "bug" in the arcade version as well. I can't believe it's a feature.

I agree, I'm glad the die-hard 8-bitters have already gone through the
trauma of being orphaned. There are some 'ups', though. I'll quote
from an article I saved from the local paper from Jan, 1990 featuring
questions and answers on Personal Computers.

Q: Isn't there a danger that the computer I buy now will become
obsolete?
A: That's one of the great myths about computers. Computers will never
become obsolete. A computer you buy today will do exactly what it
does--be it word processing or game playing--20 years from now.
Yes, the state-of-the-art will change, but, like a car, if it gets
you from point A to point B today, it will make the same journey in
the same way as long as you own it (and keep it in good repair).
If you buy a computer today, in a few years you'll probably want
another, just as people moved from hi-fi to stereo and from
black-and-white television to color. Did those people get value
from their hi-fis and black-and-white TVs? Undoubtedly. Will

you get value from one of today's computers? Almost certainly.

Prices for used software and hardware have never been lower. My system still does everything it did when I first bought it (plus a few more things). It may be getting older, but not obsolete.

Roger Cole

1100. DEMOS! MAPPING THE ATARI!

Newsgroup: comp.sys.atari.8bit

Boy, I'm having a fun day today. Lazing around listening to most of the demo's I've accumulated in my year & 1/2 of BBSing and reading Mapping The Atari!

I wonder, I'm a little lost with trapping the [reset] key. Now that I mention it, I think Itay Chamiel might've explained it to me once, but... alas.. I have no hard drive so I know where NOTHING is anymore!!!!! AAAAAHHH!!! I think I'm in dire need of an MIO or that KPI or something. What's the cheapest/what can be connected to a "stock" (no PBI port!) 1200xl.

btw: anyone know how to fix a busted SIO port!? My upgraded 1200xl motherboard doesn't talk to the printer and it sends trash to the modem! UGH!

Also, finally. Does the MIO support modems. I forgot already! :(

I REALLY need to get some hard-copy info on all these gadgets! ;)

thanx!

Bill,

Megablast can be found in the Demos/ directory at atari.archive.umich.edu

No idea about ZIP, but it sure would be great. I've been wanting to
look at PABQWK for a while, but the only BBS I call around here supporting
QWK packets also only uses LHArc or PKZIP as compression methods for
downloadable QWK packets.

It is in /8bit on atari archive and it is called mblast.arc

It is on a disk with a demo, if I remember correctly.

It is awesome on a 130XE because of the music samples.

The US Doubler was made by ICD, and it allows a 1050 disk drive to operate in true double density (180K per disk instead of the usual 128K). And, when used with Spartados, it has Ultraspeed (that's what the US stands for), which transfers data between the computer and disk drive at 2 or 3 times faster than a standard 1050.

That is quite correct. K65.COM comes with the ATARI 850 "R:" handler appended. There should be --TWO-- files in the KERMIT65 archive: K65.COM and K65NR.COM. K65NR.COM stands for "NO R: HANDLER APPENDED". You would copy this file to KERMIT.COM and append your hardware specific "R:" device handler onto the file. (Isn't all of this in the instructions that come with the .ARC file ?)

SuperArc and SuperUnArc 2.4 are the best .ARC programs out on the
8-bit, but there haven't really been any other programs written to support
the other compression formats. Bob Puff did also do a little work on an
unLZH program, but stopped working on it, although a somewhat working
version of it is "floating" around -- much to Bob's dismay. It would be
nice to get compression formats such as LHA and ARJ, as well as ZIP,
working in the Atari 8-bit world.

Bill....you still need a PBI to run an MIO or a BB so if a 1200xl
doesn't have one then the 1st thing you need to do is invest in
one of those $30 800xls I've seen advertised here and on GEnie.
Yes...the MIO and the BB have modem ports...with the BB you can
also get their "Floppy Board" and hookup high density IBM drives.
I've never seen a BB forsale used but MIOs are sometimes advertised
here...if you get one an isolated, grounded circuit with good
surge and spike protection is a must...also have one on the phone

1120. Gauntlet

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-19 09:37:00 UTC
From: st22r@rosie.uh.edu
Message-ID: <19APR199304372208@rosie.uh.edu>
Source record: 107432

I am not talking about Gauntlet, the game with the warrior/wizard/valkyrie/elf going around a dungeon killing stuff...

I am talking about the one with the little ufo-disk-spaceship type of thing going from screen to screen shooting stuff with lasers and heat-seeking missiles and things called "tridents." It wasn't a colorful games, but close to hi-res for the 8-bit. It was one of my favorite games and have about 40 or 50 screens. You would have to shoot your laser at the ground to make holes so you could fly to the next screen. I like it for the motion and physics of the weapons and enemy space ships.

Anyone seen this game?

1121. Re: New 800xl owner... again

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-19 10:10:59 UTC
From: gkomatsu@uhunix.uhcc.Hawaii.Edu
Message-ID: <C5q6yC.6EB@news.Hawaii.Edu>
Source record: 107431

I fiddled around with the 800xl and still don't know what the
mystery switch is. (For those who don't know, I recently picked up an
800xl with an unlabeled extra switch which the previous owner put in.
It's NOT the channel selector.)

It doesn't seem to be an OS switch, at least not by any test
that I've tried. It starts up with the "READY" message in both settings
and flipping it while the computer is on doesn't seem to crash it. It
doesn't appear to be the Omnion(sp?) modification that someone suggested.

Also, something I noticed when running the Memory Test. The manual
says (and shows) there should be 48 squares for the RAM test. I only
turn up with 40! (no matter what the setting of the mystery switch.)

oh well.... anyone have carts to sell me? =^)

In article <HTB12B5w165w@cyberden.sf.ca.us> phbill@cyberden.sf.ca.us writes:

1123. New 800xl Owner

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-19 22:58:41 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9304192238.AA25016@smithkline.com>
Source record: 107434

New 800XL owner Galen Komatsu arouses my curiosity with his mystery switch.
If memory serves me correctly I think he said this switch was between the
video port & the TV switchbox jack. That's a REAL strange place for a toggle
switch.

All you other guys keep saying the switch is for some custom OS, like US+ or
a Newell RAMROD board. NO WAY! The switches for those OS upgrades are always
installed way over on the other side near the SIO port. Someone said Galen must
mean the TV channel selector switch- but that's a SLIDE switch, not a toggle
switch (I hope Galen knows the difference).

There are only two upgrades I'm aware of that would give cause for placing a
toggle switch in the location Galen describes:

1.) The CV-disconnect switch in the Super Video Upgrade;
2.) The BASIC enable switch in the Newell 1-meg upgrade.

If Galen's machine has either of those upgrades, he made a helluva bargain.
Assuming the upgrade wasn't a botched/butcher job....

From: anyone@cyberden.sf.ca.us
Message-ID: <DXma3B2w165w@cyberden.sf.ca.us>
Source record: 107447

I sent for the Rubberball and Qikdemos 4/5 (minesweeper & glaggs) 4
different ways:

Requesting from "New" directory
Requesting from "Demos" directory

and

all capitals
all lowercase

(one of the newer uploaded files to the archive (cvsquash?) was in all
capitals, much to my amazement, since only directories should have
capitals (the 1st character only) and the rest should all be lowecase)

Anyways, I got the two QIKDEMOx.ARC files from the archives, but no
rubberball. I also got a message telling me the 3 other variations of
the QIKDEMOx.ARC files I tried to send for didnt exsist, and that all 4
of the RUBBERBA.ARC files didnt exsist.

So whats the REAL name for it? It sure isnt RUBBERBA.ARC!!?

Indeed I have... I still play it and last month I have to admit I played it daily for about three weeks. It is a great game... and even shareware at that.

At least the version I have is shareware. There was a registered version available but I never saw that one.

It supposedly had more enemies etc...

BTW, it is 50 screens total... Of all the games I have I play Gauntlet,MULE, and Leader Board golf the most... They are my all time favorite classics.

I have seen/played it, but I did not really like it that much.. I
actually thought it was pretty lame. But then I prefer better graphics
then it had. I played the other one too with the
wizard/elf/warrior/valkyrie and thought it was much better...

The American T-V catalog has a list of programs Chipmunk will copy. Mech
Brigade is listed, but the list only goes up to "P", so one can't say from
this copy of the list whether TAC is copiable as well.

1. The Best program I have found to D/L files from the archive is
BoBterm 1.20.
2. I have Been aBle to recieve in two ways.
a. Screen dump.
B..x-modem
3. If your BBS has file work area where you can send a copy
of your mail to then do that and then set your
BoBterm to recieve x-modem/atascii to ascci convert
By pressing the (shift) key at the same time you
press the (1) Key [in other words the (!) key.
4. Get Textpro 4.54 to strip and the "junk" from the file
and if the file is larger than your text Buffer
then follow the directions for loading large files.
5. then run that through your UUdecoder, etc.

Hi!

On April, 3rd I attended the all Atari XL/XE fair in Halle, Germany. I met someone who is desperately searching for the GOS system (this cartridge based graphical operating system, from REEVEsoft I think).

He is willing to pay a reasonable price for the original GOS with docs.

If you'd like to part your GOS cartridge with him please contact:

Stefan Bernasch
Petrosawodsker Str. 38
O-2000 Neubrandenburg
GERMANY

If you don't have GOS but know a supplier where Stefan can get it from, please notify me and I'll pass the information to him, thanks.

I have a catalog from Alpha Systems, which has the full list of programs that Chipmunk is supposed to "back-up." Mech Brigade is listed here (too) but not TAC. Alpha's catalog lists a "Hack Pack", "Scanalyzer", and other stuff which may be useful to you. Try calling them at (216) 668-6469 and asking for a catalog.

I recently dumped some software via FTP. It's sitting here on my PC
and I'd like to send it over to my 130xe. Problem is that my 850
interface is dead (with the 850 power on the 1050 will not work - 850 off
and the 1050 runs :(The question is (since I don't know enough about
electronics to fix the 850): Is there another way to port the software to
the 130xe without using an 850? Possibly via the PC2IO setup? (which
would of course require building the interface).

It may be a video enhancement modification. Look for a slight increase
in clarity when you flick the switch. It will be subtle.

Other than that... I dunno. If you cannot find its purpose, I suggest
labeling it Magic/No Magic, and fiddling with it occasionally. Especially
right before big tasks or games that may tax your poor little computer's
electronic heart.

I have a game called Encounter, that is basically the same as Battle Zone.
I do not know if there are other versions of this arcade game out there.
It is a fair game. The Battle Zone game had the monochrome vector-graphics
type display, right? Encounter has solid objects, and the barriers are
pillars instead of triangles and blocks. The targets you get to kill
are not half as thrilling as the arcade game. IF I remember correctly, they
are just balls.

1148. C-compilers

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-21 12:42:32 UTC
From: wijdeven@es.ele.tue.nl
Message-ID: <WIJDEVEN.93Apr21124232@mamba.es.ele.tue.nl>
Source record: 107306

What is a good C-compiler for the 8bit?

I tried cc65 but it didn't work. Under Mydos 4.50 it loads OK, but I don't get the prompt (the program just returns to dos).
Only with SMARTDOS I get the prompt. But when I enter a filename to compile, it says 'no errors found', then makes an empty .obj file (with only the first letter of the entered filename as name ????) and then returns to dos.

Then I tried DVC_C. According to the sources that came with it you could do a lot of nice stuff with that compiler. But I couldn't get it to work.
The executables can't be load with MYDOS, SMARTDOS or DOS 2.5.
Further dvc_c.arc contained a dos.sys file and a autorun.sys file, so I put everything on a single density disk. But after booting the computer locked up.

Maybe I need more than 64KB for cc65 and SPARTADOS for DVC_C ??

Then I got cc8 (together with acec) and finally this one worked. The demo sources looked a bit like those of DVC_C. But DVC_C seems to have more handy routines.

So which one is a good compiler, and how can I get cc65 and DVC_C to work.

(By the way, I have a 600XL with the atari 64KB expansion thing on the back. But I'm busy trying to put in 256KB)

I LOVED this game! I still have it around somewhere... It was great, but I only had the first 25 screens (weren't there 50?). There was some other explosive weapon called Stryex or something (or is that the facial pad? :)), that exploded along a certain latitude and totally destroyed everything there. It was a little like the OIDS game on the ST, only without the OIDS. Heheh.

There is a real conversion of Battlezone. Atari released it as a cartridge for the XE Game System... should run on any XL/XE machine (don't know about 400/800/1200XL though).

Analog had a review of it. Positive, but seemed sluggish at times. They emulated vector graphics, like the arcader.

Atari did a 2600 version around 1984. It used raster graphics.

Encounter was a a 3d tank game, but wasn't much like Battlezone otherwise. Only obstacles were pylons. Enemies were various shapes. No speed problems with it! A Synapse classic.

I have a bunch of Atari 8-Bit hardware I want to sell.
I have the following:

130XE - 576K Expanded Memory
20 Meg Hard Drive Setup for 8-Bit
include: casing, fan, power supply, adaptor for
130XE or 800XL.
PR Connection
include: both modem and printer cable.
SpartaDOS X Cartridge
1200 Baud Packerd Bell Modem
1020 Color Plotter
Indus GT 5-1/4" Drive DD DS
1050 Disk Drive
include: 1050 Doublers (better than US Doublers)
Write Protect Swtich
1050 Disk Drive
2 5-1/4" Hole Puncher
Atari Writewriter Cartridge
2 Joysticks
Broken 65XE
Boxes of Disks
Computer Manuals

All hardware comes power supplies and cables, plus most manuals.

Everything sells as a whole for $325.00 plus shipping.

Send E-Mail to "bong@brahms.udel.edu" for more information.

Jos,

Hmm, CC65 is a really neat compiler. It may be slower to compile, and link the files than any of the others you mentioned, but some folks on GEnie did some libraries for it a couple years ago, and recently some other nice fellow did some libraries for accessing 64K of expanded 130XE type RAM with it. I tried it with SpartaDOS and had no problems. Perhaps you could try SpartaDOS, or DOS XL, or OS/A+.

I've recently figured out how to do YMODEM transfers to/from my unix machine, whereas before I was stuck with Kermit which ran really slow over here, even at 2400 baud. When I find some time (yeah right) i'll upload the libraries for CC65 that were posted on GEnie but for some reason never appeared here.

William,

Radio Shack used to carry what they called Joystick extension cables,
which had all 9 pins connected. You could chip off the male end, and leave
the female end on the cable to plug into the computer, and then do what
you want with it. Other wise, they also sell solder cup type
DB-9 connectors. These don't fit as well. Use a nibbling tool to nibble
away at the tabs on the DB9 and it'll help.

>the prompt (the program just returns to dos).

I've installed CC65 under MyDOS, and it works. The only problem is,
that I have to press RESET before I start the compiler.
If I do not, cc65 reacts the same manner as you described.
The second problem is, that cc65 expects all files in the drive,
that the source filename indicates (for example cc65 xxxx.c, then
it will look at the standard D:, cc65 d2:xxxx.c, then it will look
ind drive 2 for its include files).
I install all files at the ramdisk, set D: to drive 8, and then
the compiler works completely via ramdisk, what is the only
reasonable way to work with cc65.

>Then I tried DVC_C. According to the sources that came with it you could do
>a lot of nice stuff with that compiler. But I couldn't get it to work.

That is a great question!
("What is a good 'C' compiler for the 8-bit?")

I am sorry to hear that you are having trouble with CC65. If I remember correctly, CC65 is invoked in very much the same way that VAX/C is invoked on a Digital Equipment Corp. VAX/780. The syntaxes of the two command lines are very much the same. As I recall, the source compiled to object very slowly, and didn't run particularly fast. This may have been because CC65 either offered more options than the other 'C' implementations, or perhaps the compiler needed Charles Marsletts' "Fast Floating Point Package".

"A.C.E. C" and "CC8" derive from the "DEEP BLUE C" package, if I remember correctly. The Deep Blue C language derivitives seem to run much more quickly on the ATARI 8-BIT, but this may be because they are smaller implementations. CC65 may offer floating point Reals whereas ACE C/CC8 may work only in integer math ?

There are two other implementations of 'C' that I know of for the ATARI 8-BIT. There is a TINY-C/SMALL-C implementation of 'C' based on the BYTE MAGAZINE articles on how to implement SMALL C and SMALL PASCAL on Z80 and INTeL 8080 platforms. Then, there is the commercial implementation of 'C' called, "LIGHTSPEED C" in which the first version of "ARC" for the ATARI 6502 8-BIT was written before BOB PUFF made his famous re-write of this package. LIGHTSPEED C was available Apple 6502 platforms as well as the ATARI. It seemed to be a very professional product compared to other early 'C' compilers. I don't know how it compares to DVC. I also don't know if any games or commercial products were created using LIGHTSPEED C.

My hunch is that CC65 is probably more generic than the other 'C' implementations. FORTH and LOGO are probably some of the more powerful 6502 languages, but I wouldn't know where to go to look for program source in FORTH. So as most programming examples these days are created in 'C', I can sympathize with your quest for a good 'C' compiler. I know next to nothing about DVC, but would not mind learning more. I seem to remember CC65 coming out before the 130XE was publically released, so I think the package should work on your XL. I have an 800XL and I remember getting the package to run. I don't know whether CC65 runs on a 600XL, or whether the PBI RAM Expansion Card might interfere with what the code looks for as its memory map for program execution.

* The old ANALOG Computing column "Ask Sally/Mr. Forth."

* The Forth Interest Group sells diskettes full of Forth code
for $6. There's everything from LISP-like list processing packages
to expert systems.

* An online Forth source code depository is also available; see the
comp.lang.forth FAQ for details.

* There are several Forth books on the market that come with
disks. _Forth: The New Model_ details the upcoming Forth standard and
has lots of sample code (an OOP system, for one). _Scientific Forth_
is from a "Forth as an alternative to FORTRAN for scientific computation"
point of view and includes *lots* of code for dealing with matrices,
solving systems, conversions, numerical analysis, FFT, etc. It assumes
you have a math coprocessor (for the PC) but could be converted
without too much difficulty, if you know what you are doing.

* Dr. Dobb's Journal, before all the "professional programmer" nonsense
started, used to print lots of Forth code.

My advice is to check garage sales or flea markets. You can usually pick up
a used joystick for 50 cents. A lot cheaper than buying a connector and
some cable. A lot neater also. Sometimes you can even find a cheap
joystick in toystore closeout bins. Since you don't care how cheap the
joystick is, the buck for the whole thing still gets you a low cost cable
with the connector attached.

>and I thought I'd always remember those hex addresses.).

Indeed, the I/O address space can't be switched to RAM. Physically every XL
has 64K RAM on 8 DRAM chips. So, the 2K is simply never used, is it?
I wonder if someone has tried a hardware hack to access this supplement
RAM. I guess you could remap it to other addresses, couldn't you?

The connectors for Atari joysticks are standard DB-9
connectors available at radio shack. The hood they sell for them
however will only get in the way, so you have to leave the
soldered ends open.

Radio Shack sells both the male and the female ends....sq

1168. What to get?

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-23 04:05:53 UTC
From: eagle@garfield.catt.ncsu.edu
Message-ID: <1993Apr23.040553.12329@ncsu.edu>
Source record: 107327

Hi guys. I'm wanting to get into some video games now. Now, don't run away yet. I've always wanted an Atari 800 or 400 to play some cartridge games on.

But, tonight I just heard about the entire line of Atari 8-bit machiens (the XL's and XE's). I really just forgot totally about these (I use a 32-bit IBM). (As an aside, notice where I'm NOT looking for games--IBM.)

What I want to know is this: should I really be looking at the Atari 8-bit machines? I was considering buying a used Atari 2600/5200/7800, but now I'm rethinking my strategy to include an Atari computer.

The types of games I want to play are all of the classics--Asteroids, Pac-Man, Centipede, Pole Position, etc. Are the computers what I should be looking at? Or should I just stick with the 2600/5200/7800's?

Thanks for your help!

Daniel

Source record: 107328

Patrick.

Check the FAQ that gets posted here. What you are looking for are two programs in particular: Omnicom or Kermit65. Both offer vt100 emulation. Some prefer one program over the other for differing reasons. If you have an XEP80, checkout VT850b1, which I still can't get to work. (arrgghh!) So now, I read news via a local BBS and Bobterm most of the time, and read e-mail on the UNIX system.

There are several places which would carry either program. Check the Public Domain software houses like BellCOM in Canada, and LAPD in Lake Almanor, CA. You can write them at:

333 Peninsula Drive
Lake Almanor, CA 96137

Or, if you have some way to transfer files from the internet to your 8 bit, FTP to atari.archive.umich.edu and look in the 8bit/ directory for the above programs.

Hope this helps:

Marek,

Geeze, the things people will do for 2K!! Better to
just add in some 256K DRAMS ala the Claus Bucholz upgrade or similar
130XE type memory upgrade. Probably just as cheap as the circuitry
to get that 2K accessed.

All the games you mention are available for the XL/XE series (as
cartridges and even on disk). Pole Position for example is MUCH better
on the XL/XE than on the 2600.

So better buy a 800XL/XE, 130XL/XE than just a game machine like the 2600.

I use Lightspeed C for the 8-bit. It costs about $39.95 (US) if they still
sell it. Had a real nice editor. Be warned that it is only a sub set of
full C. you can't do structures and unions and a few other things.

>be looking at? Or should I just stick with the 2600/5200/7800's?

All the 2600/5200/7800/8bit computers play the classics. My rundown:

2600: primitive graphics, primitive sound, but huge software library. I
wouldn't bother.

5200: graphics & sound equal to the 8-bit computers, but small software
library and little support. (people are always looking for 5200
controllers)

7800: graphics BETTER than the 8-bit computers, but same primitive sound as
the 2600. Runs all 2600 games, plus 7800-specific games.

800/XL/XE: good graphics & sound, flexibility of keyboard, disk drive. If
you really want a "game system" you could even find an XE Game System.

Personally, I still think the best games on any platform are on the
800/XL/XE computers.

The 2600 versions of the games, while some people like the novelty of them (like me), just aren't a lot like the arcade games.

The 7800, 5200, and 400/800 versions of the classic games are practically identical. Things you should look at otherwise: 1) the 5200 controllers stink, and the games are hard to find. 2) the 7800 controllers are better, but not much. And the games are hard to find except for a limited selection sold at "Big Lots." 3) if you get ANY Atari 8-bit computer, you can use all of the computer games. You can get: 400,800,800XL,600XL,1200XL,65XE,130XE. If you can find one cheap enough, try to get an XEGS. It's an Atari 8-bit computer specially packaged for playing games (plus it has a neat detachable keyboard). Plus, the 8-bit line uses the same joysticks as the Commodore 64 and Amiga (and Atari 2600), so finding a good one is possible (look for the WICO controllers if you can still find them!). (Also, the Genesis controllers work in some systems, like the Amiga, but mine didn't work with my 800XL. Disconnecting a couple of wires would do the trick, if you like the joypad-type controllers).

There is a version of _almost_ every classic game for the Atari 8-bits. You just have to look hard to find the cartridges (most people have them, unfortunately, through cartridges which have been dumped to disk files and spread on BBSs).

Best places to look: flea markets and want-ads. People who find these things in their closets sell them very cheaply. People who collect them or still try to make a profit off of them (like BEST Electronics) aren't so cheap but are good sources otherwise.

1176. New BBS with Atari support

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-23 14:58:07 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993Apr23.145807.14035@austin.onu.edu>
Source record: 107332

A new BBS has formed at sr486.onu.edu. This bbs has an Atari room
which accepts all forms of Atari discussions. Just logon as bbs,
enter your Call Sign and register. Try it out. If there is enough
support, upload/download capability may be added. Direct any questions to
l-murdock@onu.edu
k-bacon@onu.edu

Thanks
Lance "Ate_bit" Murdock

>800/XL/XE computers.

Agreed. You can't beat original games like Necromancer and Alley
Cat (surprisingly, completely original arcade style games are
hard to come by on video game systems). The 7800 is the best for
coin-op translations, though. Joust, Robotron: 2084, Ms. Pac-Man,
Xevious, Asteroids, Centipede, and Food Fight are *excellent*
renditions of the coin-ops. 7800 Joust is the closest you can come
to having an arcade Joust machine in your home.

>sold at "Big Lots."

My only complaint about the 7800 controller is that when I have to use
both buttons a lot, my wrist gets sore after a short while. Otherwise,
it's just a typical 8-way stick (with easy to hit diagonals IMO).

As for games, they're out there if you look into the growing classic
video game scene. Video Magic sells new 7800 games, for example, for
$8 apiece.

The down side to the 7800 is that the non-classic games are mediocre;
there aren't any unqualified gems: Desert Falcon, Crack'ed, Jinks,
Water Ski, Dark Chambers, etc.

1179. 800XL Mystery Switch

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-23 20:08:51 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9304231945.AA29072@smithkline.com>
Source record: 107337

Galen's mystery switch is either part of a Super Video Upgrade or else it just isn't connected to anything.

The way to test it is to connect the machine via the monochrome output to a well-tweaked MONOCHROME monitor. A TV won't do, nor a color monitor, as the switch was designed to give ideal performance on mono. Try toggling the switch while examining the BACKGROUND of the screen. In one position the screen scan lines will be perfectly smooth. In the other position the screen scan lines will be interspersed with dots. Unless you know what to look for it might be necessary to use a magnifying glass to view the screen display. The switch position in which the scan lines are perfectly smooth is the position the switch should be left in.

The switch is obviously not part of an OS upgrade, since flicking it while the computer is on will crash the system, & Galen says he can toggle it freely without apparent effect. I know of no other video upgrade other than Super Video which employs such a switch. It's function is to remove the color clocking signals from the monochrome output, thereby cleaning up the mono signal. In the other position the Composite Video output is enabled for color monitors that don't take split video. But enabling CV with the switch also lets the clocking signals back in to the mono output which trashes up the signal for mono users.

Wait a minute? You have the shareware version of Gauntlet? The SpACE game? It has no music! Not the version >I< have!?

Or are you talking about Gauntlet, like the arcade game? And is there a S.W. version of it!?!??

Hmmm... im lost :)

How does one log on to that BBs from the Cleveland Freenet?????

1182. Ok.. so I've seen MegaBlast by Torsten Karwoth

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-24 17:23:46 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <B7Ti3B1w165w@cyberden.sf.ca.us>
Source record: 107343

NOW I wanna know what other "Mirax-Force" / "Zybex" style games are out there? Esp. the newer ones. When I heard the name "MegaBlast," I thought it was going to be like the Amiga game (which has the same music which Dean put in his "MegaBlast XE" sound demo).

Now.. I'm not dissapointed (that much ehhe)... MegaBlast is a really fun game.. GREAT sound effects. I cant wait to see MegaBlast II (since, from the "I" being at the end of the name of the current game, one would presume a part "II" is going to come out ;)), or any other programs (games, esp.) written by Torsten... and using that AWESOME sound routine! (and people still ask "is there a way to play digitized sound with the screen on?" heheheheh!! YES! And it looks like Torsten perfected it! hehe)

Anyways... I'm just interested in the Uridium/Mirax Force/Zybex/Mega Blast (Amiga)/etc. style shoot'em ups.. THe one (or two, cooperative) player games where you fly over some space ship / planet / whatever (but being bigger than Mirax Force's small ship-sized levels) and blast the heck out of enemies and parts of the space station and get all the colorful blinking flashing boxes with letters in them (hehe) that give you extra weapons, lives, shields, etc.....!

Does ANYONE know where there is such a game? I'd be happy with one that takes multiple disks, requires 128k .. 256k.. whatever! :)

Does anyone know if anyone ELSE is WORKING on such a game? :)

how many other Atari Classic'ers out here like these types of games too? :)

>
There are programs for the PC that allow you to copy files to an Atari
180k disk (ie the double density ones) with your PC.

I would recommend building the PC2IO, though. It takes about 1/2 hour, and
is fairly useful. As soon as I can put more time into it, I hope to have
a device driver for the 8bit and a program for the PC that will allow you
to store files on the PC's hard disk in normal file format (instead of a disk
image file) and access them transparently from the 8bit.

1184. Demos, and other things

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-25 12:04:22 UTC
From: djg0@aber.ac.uk
Message-ID: <1993Apr25.120422.28921@aber.ac.uk>
Source record: 107346

Right, I'm back from my Easter holiday so I can clear some things up. I haven't been reading this group over the holidays because it would cost too much money. Email is OK, but news isn't!

OK, the MegaBlast problem. mblastxe.dcm in the Demos directory is a digitized music demo written by me. It has nothing to do with the MegaBlast game (which I also uploaded to the archive) which is called mblast.arc in the main directory. Sorry about the name confusions, but I used MegaBlast long before the game appeared!

BTW: Bill, it was me who told you how to do the 8 ->4 bit sound conversion!

Next, thanks to those people who bought some of the stuff I advertised on here at the end of last month. I still have some of this left, so I will post an updated sale list on here after I finish typing this!

Next, issue 12 of the News-Disk is ready. I will post it tomorrow (I didn't get a chance to ARC it up last night - too busy watching videos, and after a 7 hour train journey.. well you know what I mean!). On this issue there is a competition which ANYONE can enter. You will just need all previous 11 issues of the News-Disk in order to answer the 10 questions relating to these issues. You can enter the competition by email. Closing date is 7th May. The prizes are good, trust me!

Dean Garraghty.

***** MEGA DEALS *****

Call me crazy if you want, but I have a lot of old stock items I really must clear out of the way NOW! This stuff is all brand new stock, and is boxed&sealed where applicable. The following prices include shipment costs to the US!

BALLBLAZER on ROM cartridge. Brand new, boxed and sealed. I have 3 of these to clear at just $10 each, which includes shipment to the US! (UK price: 4pounds).

POLE POSITION on ROM cartridge. Brand new, boxed and sealed. I have 4 of these to clear ar just $10 each, which includes shipment to the US! (UK price: 4pounds).

**** SUPER DEAL **** Buy BALLBLZER and POLE POSITION together for just $15 the pair, including shipment to the US! (UK price: 7pounds).

ATARI MACRO ASSEMBLER DISK. Brand new, boxed and sealed. Disk and 2 manuals. I have 10 of these to clear at a stupid $12 each, including shipping to the US (and the boxes are big and heavy!!). UK price: 6pounds.

DIGI-STUDIO packages 1 and 1.5 sets. These are the old versions of Digi-Studio, the digitized sounds and music utility. This pack will get you the keyboard player (to play tunes using the keyboard with digitized sounds) and a tune player to play music in digitized sounds. Loads of samples and tunes are included. You also get a utility to play the tunes in your own programs and a utility to edit samples. Great fun! These used to sell at $20 the set, but now the new full version of Digi-Studio is available I have to clear 14 sets of the old versions. You will get 2 DS disks and 2 typeset booklet style manuals for a silly price of just $5 which includes shipping to the US! UK price: 2pounds. THIS IS A BARGAIN!

EASY PROGRAMMING FOR THE ATARI MICRO book. A highly regarded British book covering many aspects of the Atari and computing in general. Still in publication, and usually sells at 6pounds in the UK. I have about 7 of these left and you can have them for just $7 each, including shipping to the US! (books are heavy, so shipping costs more!). UK price: 2.15pounds.

THE 600XL PROGRAM BOOK. Another good British book full of good type-in programs for all Atari 8bit machines. Usually costs 5pounds in the UK, but I have 5 to clear at just $6 each, including shipping to the US! UK price: 2pounds.

HOW TO ORDER:
This is easy! I accept payment in cash in US$. Just send the cash with your name/address and order to me at:

DEAN GARRAGHTY
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

IF you are sending a large amount of cash, you may like to pay for international insurance on your letter when you send it. I can't be held responsible if your cash goes missing!

Please Email me first to reserve stock: djg0@aber.ac.uk.

> 800/XL/XE computers.

YEP! I mean, just look at Zybex, Draconus, Mega Blast, and all the
trippy sound / graphics demos!

BUT... this guy is looking for "old fashioned" style games...

Zybex is a lot like "Life Force" on the Nintendo / for the Arcade..
Draconus is a more 85+'ish Commodore / Amiga style "run around and get'em
" style game. It is SORT of like Metroid, if we need a Nintendo
comparison

Megablast is by far the best new game out! :) The graphics are pretty
good (nice animation. I sort of wish there was a little more... like
animated weapons, but.. oh well), and the sound is AWESOME.. and if it's
to be compared to ANY game, it'd have to be very close to Demons To
Diamonds for the 2600. Two player shoot'em up ... one on top, the other
on the bottom .. stuff in between.. But that's REALLY the only
similarities. (on a side note, I showed the game to an IBM user friend
of mine (who DOES have VGA and a SoundBlaster card) and wishes they had a
game like it for IBMs! haha! And I showed him some HobbyTronic demos and
he says that the IBM could never do such fast smooth scrolling! hehee..
at least HIS couldnt.. and I belIEVE he has a fast 386 or 486?)

And people heckle us! HAHA! They haven't even SEEN what we can do!
muahah!

sorry :) "Atari-owner ego trip" :)

Source record: 107351

I wouldn't mislead this guy into thinking all the computer systems run ALL the software.

Sure, most of the carts. will work on all the systems, but beforewarned:

The 400/800 had a different set of operating system ROMs, which make running LOTS of XL/XE software difficult ... no, sorry :) .. impossible. Not ALL of it, of course, but MUCH new stuff (esp. European games) can't run on the 400/800's.

As for the 1200xl, it has a different Operating System than the 400/800 OR the other XL's and the XE's.. I had a HELLUVA time running stuff on my 1200xl until I got an upgraded one which had a set of EPROMs with the 800XL operating system burnt into them (as WELL as the 800, so I don't have the problem I'm just about to explain about the XL/XE series)...

The XL/XE series, having a different (better) (any arguments to that fact, I wonder???) (don't say "Yeah! M.U.L.E.!" :^)), set of operating system ROMs can't run 100% of the stuff made for the 400/800. They also have only 2 joystick ports, unlike the 400/800's 4 ports. Atari decided that most people never play games with more than 4 (stick) or 8 (paddle) players, and used part of the chip that handles the joysticks to instead handle some memory management. Now, the XL/XE series can have up to 64K RAM, rather than the 48K RAM on 16K ROM of the 400 (upgraded) and 800 (altho some came stock with only 32K, right?). The XL/XE series can now "swap out" the 16K of ROM and see the "hidden RAM" under it. Remember, these little 8bits can see only 65536 bytes (64K) with their "addressing", (8 bits per byte, using 2 bytes to point somewhere = (8 bits = 256 x a second 256) = 65536). When we talk about upgraded (128, 192, 256, 320, 1 meg - 4 meg) 8bits, ALL of that extra RAM is seen as 16k chunks. 16K of the normal RAM is swapped out and the extra RAM is seen instead. Its like having a peice of paper with a hole in it. The hole is where one sees the EXTRA RAM (on the sheet under it), and the rest of the paper is the "always seen" RAM. Unupgraded Atari's (64K or less) only have 1 peice of paper (with no holes, of course :))..

Anyways... i TOTALLY digress :)

Just remember, not 100% of Atari software works on 100% of Atari computers. :)

True.. Let's look at a few Ninblender ... I mean Nintendo games with the same titles as the coin-ops...

Ninja Gai-den ... nothing LIKE the arcade game. Granted, both the arcade AND the Nintendo versions ARE excellent games (gasp! yes, he just admitted to liking a Nintendo game!)

Gauntlet ... almost just as Gauntlet (III) for the Lynx isn't identical to ANY coin-op version, the Nintendo verion is different too.

(BTW! SOMEBODY TELL ME ABOUT THE COMPANY TENGEN! Thank you! :))

As for the OLDER games.. Pac Man, Galaga (ooh! I love Galaga!), and a few other "oldies", the Nintendo seems to do a reasonable well reproduction. I've never seen but two (photos of) 7800 games ... A wrestling game that came out in like 1989, and Pete Rose Baseball. (btw, my friend has the wrestling game for his 2600..yes, the 7800 graphics ARE excellent! Those wrestlers looked like Graphics 9 sprites or something! VERY good coloring!)

Well... I've posted enuf about games! I barely HAVE any cart. games for my Atari! :) (5? 6?)

Hello everyone in 8 bit land. I'm looking for an 8bit atari computer.
i have heard the 800 xl is the best one to get. But I might be interested in
other models. I also need a cassete drive or a floppy drive.

Thanks people!

```
Complete Logon Directions for Citadel BBS at sr486.onu.edu

1) Internet access and Telnet capability required.
2) From prompt, type "telnet sr486.onu.edu"
3) At logon prompt, type "bbs" (case sensitive)
4) The next prompt will ask you for your nickname
Enter the name you want to be recognized by.
5) Register, entering all of the questions asked.

The next time you log on, type "bbs", your nickname,password

Hopefully, this will take care of any problems.
BTW: a new kernel was recently installed which has a tendency to
panic and crash occasionally, please be patient. If you can't
telnet to sr486, try again later, it has probably died.
A patch will soon be in place to alleviate this problem.

Thanks for the support,
Lance "Ate_bit" Murdock

Jeff,

I can imagine the expediture to do the 2K RAM-Disk, sure not less than for a really big ramdisk. Anyway, the interesting thing is that I wasn't aware of that wasted 2K of RAM for so many years. I'm interested in any kind of weird upgrades, just for fun.

You mention a 256K DRAM upgrade ala Claus Bucholz. I can't remember the name (well maybe except of the actor Horst Buchholz :-)).
Is it this upgrade with the docs lying around on the archive?

Marek Tomczyk uj1g@ibm3090.rz.uni-karlsruhe.de

1198. HELP: 256kb in a 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-26 16:10:51 UTC
From: wijdeven@es.ele.tue.nl
Message-ID: <WIJDEVEN.93Apr26161051@anaconda.es.ele.tue.nl>
Source record: 107255

This time I have a hardware question.
I don't know if anyone has an answer, I just try.

(BTW the tip from Peter Straif, pressing reset before loading CC65, didn't work for me)

I have this schematic for putting in 256KB in a 600XL but there is one thing that doesn't make sense to me.

What they do is the following:

Remove the 4416 DRAM's. Put 8 41256 DRAM's on a seperate circuit board (along with some logic). So far so good.

But for connecting the data pins (A0 - A7) of the 41256's they take A0, A1 and A2 from the first 4416 (U11) and connect them to A0, A1 and A2 of the 41256's.

Then they take A3, A4, A5, A7 from the second 4416 (U12) and connect them to the corresponding pins of the 41256.

This sums up to 7 bits and where is A6 !?

Wouldn't it make much more sense if you take A0 - A3 from U11 and A4 - A7 from U12 ?

BTW the RAS (Row Adress Strobe) signal is taken from U11 and the CAS (Column ....) is taken from U12.

Yes, you can hack a joystick cable to hook up to the IBM serial port. I
did a couple of variations on it. If you have access to the ST net I
could F-mail you the files.

> with my 800XL. Disconnecting a couple of wires would do the trick, if you
> like the joypad-type controllers).

Yea, I was wondering about this also.I had heard that they work by just
plugging them in, but when I bought one, it didn't work in my 800XL either.
I took it apart and wired in two extra wires, and it works fine now!!

I would really like to find out if it really is possible to access the
other two buttons. As anyone tried anything? (I guess the first place to
start would be to decipher the chip that is it in, which I heard was just
some simple multiplexing chip, but I'm not an electronics person.)

bbs-uelise@jwt.oau.org (sean patrick) writes:

> and the 1050 runs :(The question is (since I don't know enough about

Try downloading over to RAMdisk, since you have a 130xe.. The files you can xfer can be any larger than your RAMdisk (I assume it's 64k, ... a stock 130xe, right?) Anyways.... MyDOS and SpartaDOS both have great RAMdisk support, and I'm sure DOS 2.5 handles it well too, since it's only a 130xe. From there, once you have the files in the RAMdrive, just "back them up" to the floppy (turn off 850, then use 1050)

Would that help?

Again, no files over about 64K'd work tho.. so your stuck for now, probably... unless its all small stuff.

Jos,

I would be really insterested in seeing those schematics. TO my knowledge this is the FIRST 256K upgrade for the 600XL that I or anyone else has EVER heard of.

Is there some way this documentation can be sent across the pond for a couple U.S.A. hardware nuts to look at?

No, I don't think that program is a programming language, I believe it's some sort of application. Intersestingly enough, Word Perfect Corp. now has a stripped down word processor called Letter Perfect, which is what the Word Processor from LJK was called. Gee, think LJK could win a lawsuit against WP Corp? :) Maybe the "Look and feel" are the same too. (grin)

1212. Re: PINOUTS FOR ATARI 850

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-27 04:37:26 UTC
From: generic@rahul.net
Message-ID: <C64KuF.4AA@rahul.net>
Source record: 107265

```
R1:
Pin 1 Data Terminal Ready (DTR, Ready Out)
Pin 2 Carrier Detect (CRX, In)
Pin 3 Send Data (out)
Pin 4 Receive Data (In)
Pin 5 Signal Ground
Pin 6 Data Set Ready (DSR, Ready In)
Pin 7 Request to Send (RTS, Out)
Pin 8 Clear to Send (CTS, In)

R2:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive Data
Pin 5 Signal Ground
Pin 6 DSR

R3:
Pin 1 DTR
Pin 3 Send Data
Pin 4 Receive
Pin 5 Signal Ground
Pin 7 RTS
Pin 8 -8 Volts

R4:
Pin 1 Send Data +
Pin 3 Send Data -
Pin 7 Receive Data +
Pin 9 Receive Data - (20 mA)

Map of connector is:

5 4 3 2 1

9 8 7 5

You should use R1: for your modem communications. RS232 connections
are as follows:

Pin 2: Send Data
Pin 3: Receive Data
Pin 4: RTS
Pin 5: CTS
Pin 6: DSR
Pin 7: Signal Ground
Pin 8: Carrier detect
```

Pin 20: Data Terminal Ready

The minimum you can do and have the possibility of working is to hook up
Send Data, Receive Data and Signal Ground. Some modems may require more.
If you have trouble, the first thing to do is switch Pins 2 and 3 and try it
again.

1217. Re: HELP: 256kb in a 600XL

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-27 16:18:53 UTC
From: wijdeven@es.ele.tue.nl
Message-ID: <WIJDEVEN.93Apr27161853@boa.es.ele.tue.nl>
Source record: 107276

Well, from all sides came questions about the schematics for putting in
256KB in a 600XL.

It seems as if no one has ever heard of it. It was published in a dutch
computer magazine called 'Atari Magazine' back in 1987!!

Now a lot of people want to see this schematic and I am willing to post
it to this group, but what is the best way to do this??

Maybe in a GIF format or something like that?? (uuencoded that is)

I also got a mail from Ryan 'Goz' Collins who said that maybe the 8 DRAM's
could be replaced by a 256KB SIMM. I'm investigating this now.

BTW: I still haven't had an answer on my question in my previous post.
Although Bill Marcum send an empty article and hereby I'm asking
him to please resend it or else I won't be able to sleep tonight :-)

1218. atari.archive.umich.edu bi-annual faq

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-28 02:22:48 UTC
From: weiner@terminator.rs.itd.umich.edu
Message-ID: <1rkppo$m57@terminator.rs.itd.umich.edu>
Source record: 107278
Cross-posted to:
comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy,umich.archives,umich.post.myke.post,alt.felching.gerbils

The atari.archive.umich.edu "Just the 'faqs' faq" - an Umich Atari Posse Product

This faq has been revamped to provide just the "faqs", less talk
and more rock. Ready?

1. How the hell do I get to atari.archive?

By order of preference:
1. AFS (if you don't know what it is, you don't have it, forget I
mentioned it).

2. Gopher (Other gophers/North America/USA/Michigan/Merit/Software
Archives).

3. FTP - Be sure to check for mirrors that are closer to home. For
instance src.doc.ic.ac.uk (/computing/systems/atari/umich) and
wuarchive.wustl.edu (/mirrors/archive.umich.edu/atari).

4. Mail - Send mail to atari@atari.archive.umich.edu with a body
of help for the help file. Questions about BART to
brode@atari.archive.umich.edu

2. Uploads?

You bet we want 'em. Via afs, cp into /afs/umich.edu/group/itd/archive
/atari/New. Via ftp, ftp into atari/New (will not work at mirrors).
Via gopher, impossible, see mail. By mail, uuencoded chunks to
weiner@atari.archive.umich.edu.

3. Sacrifices in our honour?

You bet. Small children and farm animals only please.

4. Why the hell do things take so long to get from New to the
archive?

Lack of spare time. Lack of sacrifices. We're working on it. Really.

5. I'm completely confused by this post, who can clarify it for me?

I'll do my best, weiner@atari.archive.umich.edu. If that don't work,
weiner@terminator.rs.itd.umich.edu. If that don't work,
weiner@stat.umn.edu. If that don't work, weiner@beryl.labmed.umn.edu.
If that don't work, Jeff Weiner 414 Erie St SE #14, Mnpls, MN 55414.

Good night,

RGA> Any help will be greatly appreciated.

Basically, almost any program that requires a 130XE, esp. because the CSS upgrade is a very, very compatible memory upgrade. You can use PD programs such as the word processor TextPro that can take advantage of the extra memory or run QWK offline message readers such as PabQwk or QwkSilver, for example. Or use it as a RAMdisk. There are many programs which will take advantage of the extra memory.

Yeah thats a good question. I'm looking at getting an Atari 8 bit computer.
Everyone says get the 800 xl due to you can expand it. But if there is
little use for this feature, i might beable to accept a lesser unit..

Here are some of the Star Raiders keyboard commands... this is from memory, so try it before you believe it.

G - Galactic Map
H - Hyperspace Jump
Number keys - Thrust in normal space. Use this to dock with the base (just approach it slowly)
A - Aft view
F - Forward View
S - Shield (?)

I think there may be more, but I haven't played in a while (might have to break it out tonight though... I feel the need for a SR fix!)

There are many uses for expanded memory on an 8-bit system. I usually use it as a RAMDisk under SpartaDOS X (most DOS's now can support some type of RamDisk). Also, there are applications such as Paperclip, Typesetter 130, many disk copiers, that will directly use the extra memory.

To answer your other post about sound, the 8-bit has 4 channel sound capability (I don't know what the 7800 has, so I can't compare the two).

Either post or e-mail me the schematic scanned in TIFF format (1-bit per pixel, I or M format, compressed with packbits or uncompressed). If I can interpret it, I can release a TIFF viewer that would also let us print out the schematic. If you've never heard of TIFF, let me know what formats you can produce.

Ok, I've posted this message acrose the 3 main atari groups.

Is there a good history of atari and its machines?
Here is what I have constructed from word of mouth, my memory and old
issues of Compute!.

1. Early 70's. Atari founded by Bushnell releases the pong arcade game. It
was a use sucess and atari began its climb.
2. 1976, Atari had made a cartridge game system called the VCS (Video computer
system, later called the 2600). However it took a year to reach to market
because most stores didn't think people would buy such an expensive toy.
3. 1979, the VCS was a huge success. With the release of the Apple, Atari
started to develop its own home computer. I'm not sure when the 400 was
released but I assume before 1981.
The computer they release was the 400. it has 16k ram and uses the 6502
chip for the CPU. As far as I can tell it ran a 1 mhz. An upgrade
version called the 800 was released with a real keyboard and 48 k ram.
4. 1983. While the computers sold well, they appear to be losing a war against
the commadore 64 and other computers. And while their billion dollar baby
the VCS keeps making money, systems like the Intellivision, Collecovision
, computers and time itself has warn it down.
(at some tome they released the 5200. A video game system based on the
atari 400. I'm not sure when this happened. It was a failer)
5. 1984. The video game industry when bust and alot of companies where
destoryed by it. The company that own it, warner bros sold it to Jack Tramiel
in mid 84.
Also, atari developed the 7800. a revolutionary game system that was delayed
for so long ~(I think 86 was when it offical was released in real numbers and`
the nintendo, a surperior machine, although also developed in 84 had bet them
to the punch)
5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and
the 65 XE. The ST line (ST stands for Sixteen/Thirtytwo) were revolutionary
machines that were twice as power as anything else on the market. They used
the GEM windowing system and had Color and used the 68000 chip. They were
nick-named the Jackintosh.
The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
find what xl were released and when.
6. the time between 86 and 91 is very hard for me to track info down. I was
very into the IBM PC world and got few mags that said anything about Atari.
I do know at some time the 5200 and 2600 (VCS) were dropped. The 8bit
line was taken down to one game computer called the XEGS. And ST's didn't
sell well or were run over by PCs Also there were other ST models released
called 1024, STE, and the TT.
7. 1991. Atari bought the Lynx hand held game system from EPXY and cannceled

the 7800 and the XEGS.
8. 1992 to present. Things look pretty bad..

ok, anyone care to fill in details or point out my mistakes in the time line?

From: Bill.Marcum@launchpad.unc.edu
Message-ID: <1993Apr29.011940.11452@samba.oit.unc.edu>
Source record: 107293

The 850 interface contains 4 serial ports and a parallel port. It's good for connecting modems or printers to the computer, but you don't need it for a disk drive. If you're splitting up a system that had two disk drives, you will need to check the drive select switches on the back of the drive, so that each computer has a "D1:" drive.

>procedures).

I wrote the "XE-Bank" package for CC65. It provides access to the extra 64K via C functions. All the bank swapping is performed for you. Direct access is provided for common C data types, including 6-byte floats. You can use the memory as a 65536-byte array or use the xalloc/xfree routines. Everything was written in machine language. It is available at atari.archive.umich.edu: atari/8bit/Cc65/xebank.arc; it comes with complete documentation. (The down side: 128K machines must give up their ram disk.)

As for voids, et.al. in CC65: voids and enums are not supported. The best way find out about CC65 is to just go and get it and play with it first hand.

Source record: 107296

Zybex (the great, the one and only) was developed right here in the UK by
Zepelin Games Ltd, sadly Zepelin have now dropped support for the 8-bit, due
to lack of sales, this happened around the beggining of last year, a
real pity since they produced some of the best games ever to be seen on
the 8-bit, great graphics, brilliant sonics, even better gameplay.
Sorry, I don't have an address handy at the moment!

By the way if anyone is wondering, it IS possible to finish the game, in fact
once you've mastered a couple of tricks it is quite easy to do so, I've managed
to finish it 3 times in consecutive games!

On the subject of C compilers, the current issue of Atari Classics claims that Ace C compiles to machine code. Is this correct? I seem to remember, back when I used to use it, that it compiled to some form of P-code. (If it doesn't, then the code generation is *terrible*.) Anyone know for sure?

On a related note, the author of the original Deep Blue C is on the net, but I don't know if he follows this group (probably not). If the author of the AC article is out there, I'll put you in touch. I can't guarantee he'll be helpful or remember anything, but it's worth a shot, right?

Hi there. The latest version of my text viewing program for the 8-bit, VTex 1.2, is available for downloading from atari.archive.umich.edu in the /atari/8-bit directory (vtex12.arc). It lets you view any file (text or binary), converts IBM CR/LF to 8-bit CR's, pages forward and backward, has a built in help screen, and many other features. It runs under Sparta and Atari Dos's (should work under most 8-bit dos's). Get a copy and try it out.

>(or somehting like that, I can't remember the exact phrase)

For the curious, the phrase is "WHATS WRONG?", *without* the apostrophe.
I wondered why they weren't correct with their punctuation, so I dumped
the cart to disk, edited the message to be "WHAT'S WRONG?", and fired up
the game again. Instead of the apostrophe, though, I got some funny
looking character. Evidently, the Star Raiders programmer(s) had redefined
the character bitmap for the apostrophe character (probably as one of the
control panel characters).

Just another useless bit of 8-bit trivia,
Norman

Wait a minute wait a minute..
does the genesis controller really have a chip!? I know the Ninblender has a chip in it, which is how they compress 4 directions and 4 buttons down to like 5 pins.....

oh well..anyways... i heard that buttons A and Start can be ready by checking some other bit and if IT's on, then A and Start are on, otherwise B and C are...??!

Also...why do you have to rewire the Genesis controller!? I pluged a normal Genesis controller into my 1200xl and got the pad and B and C working just hunky-doory!

Did Sega redesign em or something????

Also..I'd guess that making controllers such as the TAC-2 act like Sega Genesis controllers (at least, say, if one were to make a game for the Atari classic that used the Genesis controller (using only [B] and [C]) either the upgraded TAC-2 or stock Genesis would work) would be no hard task....

just get a stick cable with ALL pins (or at least the extra ([C] button)) and replace the TAC-2's cable with it, then rewire it just the same as it was, except for the right button.... make IT be the [C] button...

course, im going to have to hack open my TAC-2 to be sure 'bout this ;)

Also..maybe make it switchable!? ie..Standard TAC-2 mode (both buttons are standard button) and Genesis TAC-2 mode (left button = [B] (normal) and right button = [C] (which is paddle0 i believe???))

hmmm... i think i might just do this! :)

WHY GET EXTRA RAM!?!!?!??! >>WHY<< GET EXTRA RAM!?!?!?!?!?

THAT is an unCALLED for question!!!

Actually, it's not... but here's a VERY good, first hand experience of
why having extra RAM is helpful:

Actually, 4....
RAM disks,
you can run some of the better software, (ChromaCAD XE, MegaBlast (with
better music), and much more)
RAM disks,
RAM disks,
and RAM disks..

Ok......... Why RAM disks!? BECAUSE THEY ARE FAST!!! And helpful
(unless you have often brownouts/blackouts :)).

[C]opying files,
multiloading files (ala using APACView to view GIFs in different modes
and to turn them into colorviews),
compiling programs (in C, Quick, Action!, etc.) is VERY fast...
and download/upload load/save time is DRASTICALLY reduced! (imagine
saving BobTerm's 12k buffer in about 2 seconds or less compared
to a half a minute or more) (estimations!)
(your phone bill will thank you!) :)
unDiskComming, unARCing, etc. are all sped up ... just donwload to the
RAMdisk, then unARC to the RAMdisk or to the floppy, or unDiskComm from
the RAMdisk to the floppy..... VERY fast! (esp undiskcomming)

also, it acts like a second drive. If you have 1 drive, you'll like 2
drives... if you have drives, you'll love a RAMdisk :)

esp. a 192k one! (like I have)...they're bigger than 1 doubledensity
disk! .. soooooo....

you can have:
DUP.SYS - your DOS menu
DSKCOM32.COM - disk communicator (maybe!?)
whatever.DCM - a NICE, BIG DiskComm file
all in your RAMdisk..
btw- we're EvEN AssUMING THAT THE .DCM is an enhanced or DOUBLE density
disk image!

it's VERY helpful, inotherwords

:)

get xtra RAM!
:)

1248. Re: Sound

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-30 01:09:47 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <13os3B3w165w@cyberden.sf.ca.us>
Source record: 107207

rcmerrit@apgea.army.mil (Robert C. Merritt <rcmerrit>) writes:

>
> Is it true that the sound on the 8 bit computers are better that the 7800?

Yes... The Atari 7800 has the same, less advanced sound chip in it as the 2600 has. The Atari computers have the Pokey, which (until lately, I bet, with the introduction of SoftSynth and Torsten Karwoth's cool digiplayer he added to his game "MegaBlast") are supposedly not quite as good as the C=64. Technically, they aren't. Comparing the best synth. modes of the POKEY and the SID (the C=64's), the SID has 3 voices and seems to play quicker and is more easily programmed than the POKEY (which as 2 voices), but both play digitized sound, have very good sound, etc.etc... and again, lately the software coming out has been putting the POKEY to the test... and it seems to be passing :)

Same with the ANTIC/GTIA... the introduction of APAC mode, Interlaced APAC mode, and (not to sound egotistical), APAC-2 mode (which I made to overcome the difficulties of programming graphics in APAC mode), NOT TO MENTION ColorView (and ColorSquashView)!!!!!!, have proven that these little machines really CAN do some awesome stuff!

And people today were impressed by A.N.A.L.O.G.'s "MAZEWAR" on an Atari 800 today! (IN A ROOM FULL OF 486's with VGA, no less!!)

:)

First they say "hey! eheheeh!!! haha! it's an ... ATARI!!" .. then they say "hey, that looks like a cool game!" and some even say "too bad we dont have something like that for the [IBM / network]"

hehehehhehehehehehehehehehehe!!!!!!!!!!!!!!!

```
Star Raiders commands!
<again!>
:)

0 - 9 twin ion engine control (speed) (also aborts hyperwarp)
A aft (rear) view
C computer attack control (the computers, really)
F front view
G galactic chart (map) ([fire] DOESN'T warp.. go back to [F]ront view
(or aft) and hit [H] for hpyerspace.. keep target in center!)
H hyperwarp
L long range sector scan (top view, sorta ... i love it!)
M manual target selector - change which enemy the computer is targeting
(showing distance/angle data and "looking" at (switching rear/
front view, and placing on the little mini-screen on the front
view))
S shields.. id turn'em on if i were you!
T tracking computer (sorta like the 2nd part of the "computer")
(playing the game gets you used to what T and C do....
also notice the "T" and "C" at the bottom of the screen...
it informs whether the tracking computer is on (C) or off (T)
and which enemy its tracking (0-3))
P pause... dont pause too long or you get a blank starfield (game
aborted)
Atari fuji (400/800), Dual triangles (XL/XE) (aka "inverse" button!)
abort game! (whimp! ;) )

to dock- line up the base in your sights and shoot... jk... dont shoot!
if youre close enuf (hit "9" and "0" to start up and stop... to sort of
inch your way closer) a little guy'll fly up and fix you... itll say
"orbit established"... dont move... or itll abort (docking aborted) and
the little man will just float around :)

DC: (damage control) letters:
(yellow-damaged, red-destroyed (pretty realistic!..rather than
"ok/destroyed") :)

P-photons/phasers/whatever
E-engines (hyperwarp ALWAYS works..)
S-shields
C-computer
L-long range scan
R-radio (updates map, tells you when a starbase is surrounded or
destroyed, etc.. youd hate to go to a sector that USED to have a starbase
```

and end up flying into zylons! hehe)

chart characters-
* - star base
- - you/cursor (therere two)
=> - 1 or 2 zylons
=- - 3 zylons
== - 4 zylons

(* = star/asterisk shap
- = small colored blinking dash
=> = space ship shape
=- = three blue dashes
== = 4 blue dashes)

game screen character meanings:

V:00 K:00 E:9999 T:1
0:+00 O:-02 R:+999

V="V" velocity (speed)
K="K" kills (zylons destroyed)
E="E" energy
T="T" target mode (a "C" when the computers on).. again the # is what
enemy is being tracked (see next line for tracking info)
0=an O with a "-" thru it (theta?) ... vertical offset (align to 0 and
the enemy is in front of you, as if on the horizon)
O=an O with a "|" thru it .. horizontal offset (align to 0 and it's
somewhere directly in front of you... +=on the right, -=on left)
R="R" .. range.. how far in front (+) or behind (-)

these last three again refer to the currently-being-tracked zylon

Will explain rest in next post!

>>> phbill@cyberden.sf.ca.us <<<

1250. star raiders, cont

Newsgroup: comp.sys.atari.8bit
Date: 1993-04-30 01:32:38 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <45Ps3B5w165w@cyberden.sf.ca.us>
Source record: 107209

ok...as for the targeter on the bottom right of the front view:

```
---------------
| | |
| --------- |
| | | |
|--| |--|
| | | |
| --------- |
| | |
---------------
```

The center box is where the enemy'd be if you could see him on the screen (if he were close enuf, that is)

Outside of that he is either way off to the sides or behind you (in which case, if you had the [T]racking computers on, you'd be looking behind you anyways (where there is no tracking targeter))

When there are two dashhes above the "--" lines in the center of the box, you are aligned horizontally

When there are some below it (as well as above) you are lined up...

When there are the above 4 dashes around the "--"s, AND there are squares on the bottom of the box, you are lined up >AND< are in range (close enuf)....
THEN IS WHEN TO HIT FIRE!!!! :) ... BOTH photons will fire simultaneously, and they will AIM FOR THE ZYLON... they USUALLY hit it, and hurt it BAd! :)

oh yeah, the:

|-O-| is the zylon! :) ... thats not the shape of WHAT type of zylon it is (the "|-O-|", "/-\" or triangle-on-a-triangle shape), but just WHERE it is... distance isnt represented here, either...

maybe SRIII'll have all these niceties!? 8^]

well...just the basics of SR!!

have fun!

hope ya didnt mean SR 2!!

heheh

Hmmm, is this another 1200XL oddity? I couldn't get the Genesis controller
to work on my 800XL at all (works fine on Amiga, 7800, etc) and someone
else said he had to modify his to make it work.
I know the 400/800/800XL (etc) have a couple of pins of the joystick port
wired for voltage out (which could have something to do with the problem).
Is this different on the 1200XL?

Just some ramblings from an 8-bit non-expert... I could be completely wrong.

The Atari 400 on PAL systems ran at 2MHz. I think on non-PAL it was 1.7MHz,
or something like that.

>And ST's didn't sell well or were run over by PCs Also there were
>other ST models released called 1024, STE, and the TT.

ST's were actually VERY successful (they aren't now, true).

***** MEGA DEALS *****

Call me crazy if you want, but I have a lot of old stock items I really must clear out of the way NOW! This stuff is all brand new stock, and is boxed&sealed where applicable. The following prices include shipment costs to the US!

BALLBLAZER on ROM cartridge. Brand new, boxed and sealed. I have 3 of these to clear at just $10 each, which includes shipment to the US! (UK price: 4pounds).

POLE POSITION on ROM cartridge. Brand new, boxed and sealed. I have 4 of these to clear ar just $10 each, which includes shipment to the US! (UK price: 4pounds).

**** SUPER DEAL **** Buy BALLBLZER and POLE POSITION together for just $15 the pair, including shipment to the US! (UK price: 7pounds).

ATARI MACRO ASSEMBLER DISK. Brand new, boxed and sealed. Disk and 2 manuals. I have 10 of these to clear at a stupid $12 each, including shipping to the US (and the boxes are big and heavy!!). UK price: 6pounds.

DIGI-STUDIO packages 1 and 1.5 sets. These are the old versions of Digi-Studio, the digitized sounds and music utility. This pack will get you the keyboard player (to play tunes using the keyboard with digitized sounds) and a tune player to play music in digitized sounds. Loads of samples and tunes are included. You also get a utility to play the tunes in your own programs and a utility to edit samples. Great fun! These used to sell at $20 the set, but now the new full version of Digi-Studio is available I have to clear 14 sets of the old versions. You will get 2 DS disks and 2 typeset booklet style manuals for a silly price of just $5 which includes shipping to the US! UK price: 2pounds. THIS IS A BARGAIN!

EASY PROGRAMMING FOR THE ATARI MICRO book. A highly regarded British book covering many aspects of the Atari and computing in general. Still in publication, and usually sells at 6pounds in the UK. I have about 7 of these left and you can have them for just $7 each, including shipping to the US! (books are heavy, so shipping costs more!). UK price: 2.15pounds.

THE 600XL PROGRAM BOOK. Another good British book full of good type-in programs for all Atari 8bit machines. Usually costs 5pounds in the UK, but I have 5 to clear at just $6 each, including shipping to the US! UK price: 2pounds.

HOW TO ORDER:
This is easy! I accept payment in cash in US$. Just send the cash with your name/address and order to me at:

DEAN GARRAGHTY
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

IF you are sending a large amount of cash, you may like to pay for international insurance on your letter when you send it. I can't be held responsible if your cash goes missing!

Please Email me first to reserve stock: djg0@aber.ac.uk.

That could be it - I know the 1200 didn't want any power drawn from
the SIO port, maybe something similar was done with the joystick port.

Sega Master System controllers worked just fine on my 800XL (although
I never tried to access the second button)

Lots of people just surf along on buzzwords and popular conceptions without knowing what they mean. Over the years, a significant group has equated absolute knowledge with PC-isms: VGA = good graphics, SVGA = excellent graphics, 486 = fast computer necessary for any real work, and so on. This isn't a knock at the PC, just an observation. Similarly, people take digs at the Super Nintendo for its 3.x MHz 65816. Doesn't jive with those big numbers that get casually tossed around, I guess.

On a related note, a few years ago I knew an Amiga owner who was amazed by a game on the TI/994a...

:S shields.. id turn'em on if i were you!

Naah...If you want a really good shot at getting Star Commander Class 1, you should turn them off... =) =) (It's not as hard as it sounds.)

:if youre close enuf (hit "9" and "0" to start up and stop... to sort of
:inch your way closer)

The way I figured it was close enough to dock was to look for when three "windows" were visible on the base.

:a little guy'll fly up and fix you... itll say
:"orbit established"... dont move... or itll abort (docking aborted) and
:the little man will just float around :)

I remember hearing a rumor way back when that you could destroy the robot, but I haven't been able to do it myself. Is it possible?

:P-photons/phasers/whatever
[...]
:R-radio (updates map, tells you when a starbase is surrounded or
:destroyed, etc..

Everything else in the game is expendable except for these two, seriously. If either of these becomes destroyed, you better dock, otherwise you keep going. (If you *really* want Star Commander Class 1, that is =)

BTW getting SCC1 was so *hard* that if you docked more than three times, you couldn't get that rank. That game *really* made you work for it.

John

Hey, I`ve done it at least 5 times (I`ve lost count now :-)) with the shields
on, the only time I`ve finished the game with shields off I got SC class 2

> BTW getting SCC1 was so *hard* that if you docked more than three times, you
>couldn't get that rank. That game *really* made you work for it.
Is that realy true? I was under the impression that you had to finish the
game in approx. 8 star dates (or better) to get the rank. Of course the more
times you dock the more time you waste!
However is you lose your engines or computer then you just tend to waste
so much time engaging the enemy that it`s better to dock an get them fixed.
That`s what I`ve found at least.

>I never tried to access the second button)
>
I wonder is the second button works anything like the second button on an ST
mouse, which can be read by checking the pot lines PADDLE(0) (or maybe
PADDLE(1)) in BASIC with the mouse in port 1. With the button in one
position you get a high value returned, and in the other you get a low value.
However I found that the value you get when the mouse isn`t connected is the
same as that when the button is pressed, so if there is no mouse there the
software will think that the second button is continualy depressed.

I have never tried it with the Sega controllers, although I do know that they
work on my 65XE.

The Atari 800 and 400 almost identical internally. The key differences
that make an Atari 400 different than an 800 are the plastic membrane
keyboard and only one rom cartridge slot instead of two. Things like the
processor, graphics chips, etc are the same.

Atari 800/400 cpu is a 6502B running at 1.79 megahertz.
The orginal graphics chip was the CTIA followed some years laster by the GTIA.

The 800 was introduced with only 8k of memory, (I have seen a 4k cartridge
so I assume at one point they were thinking about that).

It may interest some of you to know that the 16k cartridge and the 8k cartridge
are also very nearly identical. Both carry 16k chips, but the 8k cartridge
has been wired so that only 8 of the 16k are accessable. For those with
some soldering experience the conversion of the 8k board to the 16k board
is not difficult.

1268. 8-bit Atari Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-01 15:59:19 UTC
From: CURRENTM@carleton.edu
Message-ID: <01GXNPWSZZ3M8Y4X11@carleton.edu>
Source record: 107226

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

The 8-bit Atari

Frequently Asked Questions List

Revised 29-Apr-93

Additions/comments/corrections having to do with this FAQ List are
welcomed by its creator and maintainer, Michael Current, currentm@carleton.edu.

The 8-bit Atari FAQ List is posted on or about the first of the month to
the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The 8-bit Atari FAQ List was created to provide answers to many commonly
asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group. At this time the FAQ List is heavily geared toward describing the
various resources for the 8-bit Atari user available, with relatively little
information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. Hence no automatic
archiving of this FAQ List occurs, though there's usually a fairly recent copy
on the Atari Archive (see below) as the file 8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
rec.games.video.arcade (includes products by Atari Games)
rec.games.video.misc (includes Lynx)
rec.games.video.classic (includes 2600, 5200, 7800, XEGS)
alt.games.lynx (Lynx)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the
Internet side of this discussion group. All contributions to the Info-Atari8
Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is

maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to
info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to
comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on
Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be
cross-posted to the Usenet side. John Dunning would like this fixed, but needs
help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the
Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to
info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
atari.archive.umich.edu is the Internet site which contains many files for
the 8-bit Atari computers. Our 8-bit Atari Archivists are John Dunning,
jrd@atari.archive.umich.edu, and Jody Lenn, lenn@atari.archive.umich.edu.
The Atari Archive as a whole is maintained by Jeff Weiner,
weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP
a) FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4)
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1)
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

Remember to set file type to BINARY when downloading non-text files
(.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to:
atari@atari.archive.umich.edu. The subject of the message doesn't matter, but
let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes),
try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the
Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your Gopher server
doesn't provide a path to atari.archive.umich.edu, try the command:
gopher gopher.ius.itd.umich.edu

4. AFS
If your system has AFS capability, this is the easiest way to access the
Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to weiner@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.
It is especially important to specify that your upload is for the 8-bit
computers, since most of what Jeff receives is for the ST/TT/Falcon.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com

For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and it
is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Free-Net via modem at (216) 368-3888. Those persons
with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.38). Applications for accounts
are handled online. Once logged-in, type "go atari" to reach the Atari SIG.
Those who add their names to the Atari SIG user directories are automatically
members of the official Atari user group CAIN - Central Atari Information
Network. Send correspondence and press releases to xx004@po.cwru.edu.

The News-Disks are available on the Atari Archive.

What product developers or vendors support the 8-bit Atari?
See the companion frequently posted text file, "All Known World-Wide 8-Bit Atari Vendors and Developers" for complete information.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that is common in the MS-DOS world. This is done to make the file shorter, so it takes up less space on your disk and it takes less time to transfer between computers. The Atari Archive contains several 8-bit Atari archivers fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are three programs on the atari.archive of this variety. Note that each requires a DOS and disk drive on the Atari end capable of the SS/DD 180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Filename:
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

Julius Hrivnac, hrivnac@cernvm.cern.ch, writes:
There's written, that it isn't possible [to read/write Atari disks on a PC]
with 1050 disk unit. But it is. There is program MLOK & HROCH, which enable it.
MLOK writes one file (<32K, I think) to a diskette, formatted by Dos 2.5
on 1050 unit. This file is written in some special way, so it can be read
by HROCH on PC.
I cannot uplode this file anywhere, because it's sold by Atari Club Prag
(Czechoslovakia).

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides
subdirectory and hard-drive support. SpartaDOS is a completely different
command-line DOS modelled after MS-DOS, though it is perfectly capable of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS
X is cartridge-based and includes many additional features. While it's hard to
argue that SpartaDOS X is not the most advanced DOS available, it is a
commercial product that is no longer manufactured. MYDOS, on the other hand,
is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for
complete compatibility with existing software, and then choose either SpartaDOS
or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 8-16K, membrane keyboard, 400/800 OS
800 8-48K, two cartridge slots, 400/800 OS
1200XL 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL 16-64K, BASIC, PBI, XL OS
800XL 64K, BASIC, PBI, XL OS
800XLF ?????, a U.K. variety...
65XE/800XE same as 800XL minus PBI
130XE same as 65XE with 128K plus ECI
XE Game System same as 65XE plus Missle Command, detachable keyboard

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.)
830 Modem (300 baud acoustic, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with ???software)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D

1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari user group?
Where is my nearest 8-bit Atari BBS?
Lawrence Estep at Atari Classics magazine maintains lists of 8-bit Atari
BBSs and 8-bit Atari user groups, each of which is too long to include here.
Contact him at 71450.1050@compuserve.com.

What are the pinouts for the...?

850 Interface Module

From: generic@rahul.net (Chris Rosenthal)
850 Interface Module, serial: (R1-R4)
R1:
Pin 1 Data Terminal Ready (DTR, Ready Out)
Pin 2 Carrier Detect (CRX, In)
Pin 3 Send Data (out)
Pin 4 Receive Data (In)
Pin 5 Signal Ground

Your general observations about the SID chip in the C64 are correct
however the 8-bit line is theoretically capable of true sine wave (not
square) generation in stereo. While speed may be a factor the 4 8-bit
sound registers can be latched together to form a true 2 channel 16-bit
waveform. As for the implementation I can't see it being done in anything
other than the fastest c compiler available or 6502 assembly/action and
at least a supercharged 130xe/800xl. That might be an idea for hacking
out (hint, hint).

Jerolim Supe'
CSE Major
Florida Atlantic University

p.s. More info on this is available in De Re Atari/Back issues of Byte and
an excellent book called Musical applications of microprocessors (the
authors name eludes me at the moment)

p.p.s. Just now are the IBM PC compatible SoundBlaster cards reaching this
level of sophistication (the POKEY had it way back in the late '70s)

I had to add two wires to my controller to make it work with my XL. Maybe
I'll take those wires out and try it with my 400 and 2600.

I read an article on the guy who programed Star Raiders, and he said that in the debugging stage, everytime someone made it to this level, he made it more difficult. I think he said the last modification to the difficulty levels was two weeks before it was burned into ROMS. There are also no Easter Eggs in the cart. (Wasn't enough room in 8K.) (I got this all from an article in Analog, if there is enough interest, I might be persuaded to post the article hear, it was a pretty interesting article. The programmer also designed the POKEY chip, but he didn't have anything to do with SR II.)

>The computer they release was the 400. it has 16k ram and uses the 6502
>chip for the CPU. As far as I can tell it ran a 1 mhz. An upgrade
>version called the 800 was released with a real keyboard and 48 k ram.

The Atari 400 and 800 were released in 1979. They ran at 1.79 MHz,
exactly half the NTSC colorburst frequency. The 800 was released at
the same time as, if not before, the 400. It also came with 16K of RAM,
officially upgradable to 48K (as opposed to the 400 which had no Atari-
supported RAM upgrade path).

>4. 1983. While the computers sold well, they appear to be losing a war against
>the commadore 64 and other computers. And while their billion dollar baby

>, computers and time itself has warn it down.
>(at some tome they released the 5200. A video game system based on the
>atari 400. I'm not sure when this happened. It was a failer)

Commodore had better marketing than Atari. Their advertisments actually
made it look like a better machine.

>5. 1984. The video game industry when bust and alot of companies where
>destoryed by it. The company that own it, warner bros sold it to Jack Tramiel

>for so long ~(I think 86 was when it offical was released in real numbers and`
>the nintendo, a surperior machine, although also developed in 84 had bet them
>to the punch)

I've said it on many other newsgroups, and I'll say it here. My belief is that Warner's selling of Atari to Jack Tramiel was the _cause_ of the industry downslide, not the result. If Warner had not split apart and sold Atari, the 7800 would have been released in 1984, possibly holding Nintendo to a tiny market share. Also, Atari probably would have retained the Amiga, and with Atari's arcade licenses intact all the popular arcade games would have been available for the Amiga.

Atari was the undisputed videogame maker from 1977 - 1984, from videogames to computers to arcade games. But as Atari grew it was managed more as a traditional big business, a fatal mistake for a market that requires creativity and innovation. Warner, instead of trying to salvage the company, took a tax write-off and sold it.

The intense interest in comp.sys.atari.8bit and rec.games.video.classic proves that the videogame demand was not dead in the early 80's. It was the _supply_ that was dead. With Atari out of the picture, there was no supply.

>5. 1985. With the winter CES Tramiel Atari released the 130ST, the 520 ST and
>the 65 XE. The ST line (ST stands for Sixteen/Thirtytwo) were revolutionary
>machines that were twice as power as anything else on the market. They used
>the GEM windowing system and had Color and used the 68000 chip. They were
>nick-named the Jackintosh.
>The 65 XE and the 130 XE were updated 8bit versions of the 800xl. I can't
>find what xl were released and when.

The introduction of the Atari ST was an incredible marketing coup against Amiga. When Commodore stole the Amiga from Jack Tramiel, Jack had the ST designed in six months. The price/performance ratio was phenominal, mostly because the entire OS, a very much Apple-like GUI, fit in less than 512K of ROM. Compare that to 10MB of hard drive space for Microsoft Windows. Coupled with 3.5" floppy drives that weren't brain-dead like the Amiga's, it was not necessary to purchase a hard drive for an ST. In fact, with an entire megabyte of memory to burn, you just put everything in a RAMdisk which of course was even faster than a hard drive. The slowness of followups, couple with the release of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit prematurely.

>6. the time between 86 and 91 is very hard for me to track info down. I was

>ok, anyone care to fill in details or point out my mistakes in the time line?

You did not cover the splitting of Atari explicitly. When Warner sold Atari to Jack Tramiel, it kept the arcade games division. Warner eventually broke that off too, and it became Atari Games. Last I heard, Warner bought back Atari Games. Also, Tengen is a subsidiary of Atari Games; Tengen makes software for the NES, Genesis, Amiga, etc.

1274. A bad experience

I just had a most unusual experience while dealing with a business. I say it is unusual because I have never before run into a business which does not want my money.

I recently placed a call to B&C Computervisions, intending to place a large order. I had already purchased one of each program that American Technavisions offers (they're a GREAT company...highly recommended) and was now moving on to B&C.

Before I could even tell the salesperson what my order was, she asked what method I would be using to pay for the items. I said I would be using my VISA card, which is what I generally use when doing mail order business. I was then asked if my name is in the local phone directory. I said no, it is not, as I prefer not to have it in there. The salesperson then said that she would be unable to accept my order in that case.

I was dumbfounded. Certainly I must have misunderstood?

I reminded her that with modern electronics, it is possible to get an approval of a credit card instantaneously, while I am still on the phone with her. (Those authorizations are guarantees of payment, by the way.)

She said that it didn't matter that she could do that.

I mentioned that I had been in the store many times before, when I lived in CA, and had used that same credit card for purchases on several occasions.

She said that that didn't matter, either, as I was no longer using the same address, and it had been over a year ago.

So, I gave up, and said good-bye.

I am wondering if anyone else has had this same sort of experience with B&C Computervisions, or with any other 8-bit dealer. Personally, I'm amazed such a business can stay in the black with policies like that. (By the way, B&C will not take COD orders, and they have a 14-day waiting period before any personal check orders will be processed.)

I wish B&C all the luck in the world, but you can believe I won't be spending my money there ever again (assuming that someday they would let me), nor will I be recommending them to my friends in the 8-bit community.

How about it folks? Was my experience with B&C an aberration? Is it a sane policy which I just don't understand?

One interesting note about the 'price wars' that Atari and
Commodore engaged in. While Commodores marketing did indeed
tend to depict the C-64 as a better machine than the Atari,
the ultimate victim of this battle was Texas Instruments.
The TI-99 was being sold for *less* than it cost TI to
produce the thing. We all know what happened.
TI dropped out of both the war, and the market to produce
a viable home machine.

I can also remember some stuff that K-Mart was using to sell
the C-64 over the Atari. It was a 4 or 5 page comparison of
the two machines that was loaded with blatant lies and
mis-truths about the Atari. Too bad Atari didn't sue the
crap out of them for that, but 'tis no use crying over spilt
milk. When it comes to aggresiveness, Atari had and still has,
a backbone made of jelly.

I would like to know how this happens, since the right mouse button on a ST
mouse is connected to pin 9, which is not connected on the 8-bit series.

I don't know if this will go out. But.
Where can I order Quick again? And will you take U.S $$? Willing to pay shipping.
RE: Bobterm giving handler not loaded error - each device that attaches to the Atari (by whatever means - bus, serial, joystick port) that lets you connect to RS232 devices has a "handler" program that runs it. So programs like Bobterm can use whatever you have attached for a modem, weither its Atari, P:R:, etc. etc. One of things that everyone is sposed to have. Best bet is to talk to B&C. Should have something public domian. Dont think i have the one you need.
Attempting to connect a VGA device to anything other than an IBM or workstation often results in overwelming desire to kill yourself.
Everyone.

The way they (B&C Computervisions) treated you over the phone is
typical (IMO) of them. I've not dealt with them over the phone,
but have visited their store in the past. The help is atrocious.
Ask a question about a particular product, and you are likely to
get no more than its price in return.
I made an 800 mile trip one time, and stopped there along the way.
I purchased over $250.00 worth of merchandise, but the people were
rude, uninformed and generally worthless as dealers of computer
hardware and software. I won't deal with them anymore because of
that. But my experience may not be the rule.
Whatever, it was enough to turn me off of them and stick with
American TechnaVision and others for my needs.

:>Naah...If you want a really good shot at getting Star Commander Class 1, you
:>should turn [shields] off... =) =) (It's not as hard as it sounds.)
:Hey, I`ve done it at least 5 times (I`ve lost count now :-)) with the shields
:on, the only time I`ve finished the game with shields off I got SC class 2

I'm not saying it's impossible to get SCC1 with your shields on, but it does take some stress off you to make all the shots count. Of the three times I got SCC1, I used shields most of the way through.

Besides, it's great to see if you're such a great pilot as you thought you were without having the shields cover for you... =) =)

:>BTW getting SCC1 was so *hard* that if you docked more than three times, you
:>couldn't get that rank. That game *really* made you work for it.
:Is that realy true? I was under the impression that you had to finish the
:game in approx. 8 star dates (or better) to get the rank. Of course the more
:times you dock the more time you waste!

I've been able to get SCC1 with stardate times of 8.3 to about 9.4 (and that's about the upper limit). It is possible to get SCC1 by docking four times, but then you really had to push your energy to about 1,500 or so before you docked again...

:However is you lose your engines or computer then you just tend to waste
:so much time engaging the enemy that it`s better to dock an get them fixed.
:That`s what I`ve found at least.

You can get around the engines being destroyed by hyperwarping into sectors, blowing up one or two enemies then going on to another sector. No need to waste time hunting down the others, since you can just warp into the sector again later.

As for the computer, it's really just a useful tool, rather than an essential one. You can track the enemies (with long range) manually, and besides it's kind of a challenge to go through hyperspace eyeballing the center of the screen... =) =)

I'd like to add to this the fact that a second Pokey can be added, via the Gumby upgrade. (get it, Pokey and Gumby?) with its sound output going to a separate audio jack. With this you could have 4 channel 16 bit sound, 2 channels left, and 2 channels right. There was an excellent set of articles on this in a previous issue of Current NOtes.

My son and I played megablast and he was using his Genesis controller
in port 2 and I was using my atari joystick in port 1 on my 130xe.
I noticed that one of those fire buttons he was pushing was rapid
fire..so the Genesis controller does work on the 130xe and I'd say
alot better than the original joystick.

You may have to switch to Bard's Tale or maybe Eye of the Beholder if you
want to continue in a similar game. The only instalment I know of that
came out for the IBM was "The City". BT isn't quite as good, but it's
close enough that if you liked "The Dungeon" you'll like BT.

You aren't being singled out, that's been their policy for YEARS. The only thing I can figure out (just a guess) is maybe Bruce got burned by one of those credit card thief/bbs groups & lost his butt. I don't know HOW they do it, but for instance: One time they broke into my line while I was on CI$. They started giving phoney system errors & requesting I re-login so I cut the connection. I talked with the CI$ technical people & they said no such messages would ever come from their equipment. Once they have your account, they have access to billing/credit card info & you're done in.

Umm, the Amiga 1000 that I have has an original drive and can read 720k
DOS disks, and Atari disks with a simple utility. It also allows long file
names, something that is still a problem for Atari, as evidenced by talks
on the other Atari newsgroup. Mac drives are the brain dead ones.
>drive for an ST. In fact, with an entire megabyte of memory to burn,
>you just put everything in a RAMdisk which of course was even faster
>than a hard drive. The slowness of followups, couple with the release
How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is

always there), or like RAD: (has to be mounted and is fixed size, and recoverable after warm boot), or like MS-DOG (has to be mounted is fixed size, can cause conficts with some progs, dies after warm boot)? Just curious.
>of the Amiga 500, 2000, and its Kickstart 1.3 OS killed the ST a bit
>prematurely.
The original Kickstart ROM release was 1.2. It did not support autobooting hard-drives. I always liked having a kickstart disk, instead of ROM.

You can make the little man dissappear by shooting your photons twice..
The first one will just fly off (or hit the starbase or whatever), and
the second one will REPLACE the man, making him dissappear and the photon
appear. You'll notice the same type of thing happen with asteroids (not
the game, but the asteroids flying around on Star Raiders)... If you
sit there and watch one, and some enemies come onto the screen and you
all start blasting at each other, the asteroid will simply mysteriously
vanish.

All that is tho is the fact that the Atari's only have 4 players
(sprites) + 4 1/4-players (missles) = 5 players worth of
of sprite junk on the screen

>
>The Amiga-Lorraine was developed by a company seperate from Atari was it
>not? I know that many of the people working on it were ex-Atarians, but
>Atari really could not retain it since they did not own it.

Atari loaned money to Amiga, Inc. to fund the development of the Amiga. While Atari was being sold to Jack Tramiel, Commodore bought Amiga and paid off their debt to Atari. Apparently legal, but the ethics are questionable.

>Umm, the Amiga 1000 that I have has an original drive and can read 720k
>DOS disks, and Atari disks with a simple utility. It also allows long file
>names, something that is still a problem for Atari, as evidenced by talks
>on the other Atari newsgroup. Mac drives are the brain dead ones.

Reading ST & IBM disks on an Amiga is even slower than reading Amiga disks. As you probably know, to read a single disk sector the Amiga must read the entire track of _raw_ data, then the 680x0 decodes the MFM encoding. Coupled with the fact that the directory structure is a linked list, practically the entire disk has to be read every time you want a directory.

>How do Atari RAM disks work? Like Amiga RAM: (grows and shrinks and is
>always there), or like RAD: (has to be mounted and is fixed size, and
>recoverable after warm boot), or like MS-DOG (has to be mounted is fixed
>size, can cause conficts with some progs, dies after warm boot)? Just
>curious.

Due to the abundance of memory, it seems everyone and his brother wrote his own RAMdisk. I just used the first one I found, which was fixed-size non-recoverable (and with the huge capacitor on the 1040ST's power supply, the RAMdisk could retain its information after 10 seconds of no power -- handy for thunderstorms).

>The original Kickstart ROM release was 1.2. It did not support autobooting
>hard-drives. I always liked having a kickstart disk, instead of ROM.

My mistake. I meant to say Kickstart 1.2. When 1.2, the 500, and the 2000 were released in 1986, it was the death of the ST.

>What happened to Atarisoft? They made Atari games for other platforms.

I believe that was just a product name used by Atari and not a separate entity. I could be wrong.

Basically, Jack Tramiel wanted to turn Atari into a computer company, not a game company. That is why he killed the 7800 just as it was being shipped to distributors. And presumably, that is what happened to Atarisoft as well. Actually, it's Tengen (a subsidiary of Atari Games) that now makes the software for the other platforms. I guess all the arcade license went with Atari Games in the split and not to Atari, because I believe it is Tengen that makes the arcade conversions for the Lynx, not Atari.

Wrong, a business that obtains an authorization is not a guarantee of
payment. All it does it verify that the card is valid and the amount to be
purchased is not above the credit limit. Generally this results in payment
but here is where things can go wrong for the merchant:

The card number could be stolen, and the bank not yet notified. Such fraud
is on the increase.

The card holder can dispute the bill, and the merchant is stuck waiting for
the issue to be resolved.

I'm guessing that the retailer must have been burned recently, or your
experience wouldn't have happened.

Vendors pay a portion of every sale to the card company each time you use the card. They are also forbidden to offer a cash discount or a card surcharge (although many do).

For most merchants, the amount paid to the card company is based on the average amount charged. Smaller averages pay a higher fee. (By the way, if a merchant doesn't pay the big bucks for electronic entry, the card company charges an outrageous surcharge on top of the normal fee.)

Now why do merchants accept credit cards?

They are generally cheaper than checks in an area where bum checks are a problem.

The merchant will get his or her money faster than waiting for a COD.

Many customers now make the majority of their purchases with cards. If you want the sale, you take the card...

Jim,

Even if the card was stolen or the card holder disputes the bill,
checking the card holder's local directory to see if he has a phone
will not decrease the chance of these things happening. There really
is no logic behind the action. As to them getting burned recently,
This was two years ago when my order was turned down.

Gee, that's odd. According to the Atari ST User and St Review that I just
picked up (April issues), there is new software being produced for the ST
even as we speak. Pretty active for a dead machine.

I use AW+ alot to write my university reports etc. I my 130XE linked to a Panasonic KX-P1123 24pin printer and have written a custom printer driver for it that works fine in all but one respect; sub- and superscripts. I really need these as I am studying chemistry and most molecular formulae have them.
My printer has an inbuilt sub/super script font, so I defined the up half line and down half line parts of the driver to select the appropriate sub/super font and then type font 5 (control G 5) to deselect the sub/super. This works fine except after using it about 20 times the program locks up. So I did a second driver that does either a forward or reverse line feed of 7/180 of an inch and this works fine, until it gets too the end of a page and the printer goes haywire doing forward and reverse linefeeds until it reverse feeds the paper up to the top of the sheet.
Also in the first driver when a second page is printed the printer selects the sub/super font and prints the whole document in that font!

This leads me onto another problem, recently when I use the print preview option (OPTION P) any text from the second page simply overwrites the text on the first page! Also the header and footer routines don't seem to work properly, ie the first page is alright but they then don't appear after that even thought the header text is the first text in the document!
All very frustrating especially when you are trying to write a report and working too a deadline!

If anybody can help me solve these problems I would love to hear from them. Also I would be grateful for any info on other word pros that have all the above mentioned features without the bugs. I know of Superscript, Text pro etc but I don't actually have any further info on their merits!

Thanks in advance

Please reply too RG9@UK.AC.YORK.VAXB

Yup. You can't really try and tell us that Amiga drives aren't very peculiar. I'd love to know why Amiga did their directory structures like they did (though I think I remember hearing something about disk-fixing), because my friend's A500 GVP harddrive used to take as long to read a directory as my Atari floppy drive, especially the root directory!

I don't know if it is sane considering the state of the 8bit market.
A company obviously needs to keep it's losses to a minimum, but at the
same time doesn't want to drive customers away with very restrictive
policies. In defense of B&C, I have ordered 9-10 times from them and
never had a problem. I have both ordered with my Visa debit card
(Yes, I'm listed in the phone book) and by mail enclosing a check.
The only negative I've found is the looooooooong wait when ordering
by check Two weeks seems like overkill when waiting for a check to
clear. One time, I needed help hooking up a used Commodore 1702
monitor I had bought locally. I called and whoever I talked to
(I forgot to ask his name) was very friendly and helpful, even
though I didn't buy anything at that time.

Wrong. Amiga Inc. was founded by 7(?) doctors etc. who wanted to invest money in something profitable. After a while (sometime 1984/1985) the money was all gone. Amiga Inc needed more money and Atari loaned them $$$. The development(sp?) went on. They came to a point where the loan from Atari took an end, and they had to look for more financial backing. Atari made a shitty offer for the stocks in Amiga Inc, and at the last moment C= made an offer which was twice what the pesimistic people at Amiga Inc. had hoped to get. So Amiga Inc. pays back the loan to Atari and becomes part of C=.
There might be finer legal points to the story, but I don't know those :).

>While Atari was being sold to Jack Tramiel, Commodore bought Amiga and
>paid off their debt to Atari. Apparently legal, but the ethics are
>questionable.

_IF_ Atari had paid for the initial development I would have agreed, but they didn't.

[about the Amiga diskdrives]
Much of the speed/slowness of disks of the Amiga boils down to a question of software. If 1.0 had the same optional filesystems that 3.0 has then Amiga disk drives would never have been called slow I think. The caching of directory entries is rather smart.

(And I still would like to find the source to StXformer :)

Yeah, I have, actually. I'm a comp.sci student, and PCs are hard to avoid. Why?

I've still got some 8 bit stuff on the block:

130 XE
Indus GT
XF551
Magnavox color monitor
810 (electronics flakey, drive ok)
ICD PRinter connection
SDX Cart
Misc cart games; Star Raiders, Asteroids, Defender,
Sub Command, Centipedes, Pac Man etc.
Lots of disks of PD software
Old Atari OS manuals
Mapping the Atari

Make offers for all or part; everything must go!

1312. Hard-Drive Horror... HELP!!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-03 17:13:34 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01GXQM7QZ9GI9ODH1G@vax.edinboro.edu>
Source record: 107173

Hi all,

Last night I powered up my system (800xl, MIO, Adaptec 4000a, 20 meg
Miniscribe Hard-Drive, and SpartDOS X) and.... well.... nothing!

Here is what happend: I always start by powering up the hard-drive and
controller. When the HD is up to speed, I switch on the MIO then the computer.
Usually (up until last Friday) everything powers up just fine and the
machine boots. Well this time, I was just staring at a black screen.
The lights on the MIO, Adaptec, and hard-drive just lit and stayed lit.
There was no head motion on the drive indicating that it was having a
difficult time trying to find track zero (like happens on drives that
drift out of allignment or are not low-level fomatted).

I even tried turning on the MIO and computer (without the dive and
controller), manually configuring the MIO, and then starting up the
drive. I even tried this on both partitions I have set up. Still no go.

The computer and MIO alone seem to function just fine.

The probelem could be in one of three places: The SCSI connctor/driver in the
MIO, the Adaptec, or the drive. The MIO seems to be the least likely, since
if functions correctly otherwise. The Drive does not seem to have any
mechanical problems since it goes through the normal pattern of head movement
upon powering it up. So I guess that leaves the Adaptec or the MFM board on
the drive itself?

Does anyone have any clue as to where the problem may actually be??????
I trouble shoot PCs at work all the time, but there I have access to other
machines with the same configurations that I can use to swap parts, etc.
Essentially, I have no base-line to compare to....

ANY help, comments, suggestions, or moral support would be GREATLY appreciated!

Thanks....
-Adam Conover.

Well, I've had a couple of email requests for this article, so here it is.
I make no claims as to it's accuracy.

==========

SUMMARY OF DIFFERENT ATARI MODELS FOR ISSUE 1004

by Jim Trageser (trag@pnet01.cts.com)

For a company that has never learned how to market its products, Atari
has produced some of the best computer hardware in the history of home
computing. From the ground-breaking Video Computer System game machine
that revolutionized consumer electronics through the 400/800 family of
8-bit computers to the powerful ST/Mega/TT line of 16- to 32-bit
machines, Atari computers have generally been at the cutting edge of
electronic technology.

Atari's founder, Nolan Bushnell, is the man who made it all possible.
Inventor and developer of early electronic arcade games, Bushnell
targeted the home market in the mid-1970s with the legendary "Pong"
system. "Pong" was a largish console with two knobs on each side to
control the "paddles" on the television screen. With only one game,
the tennis-like "Pong," built into the system and no cartridge
capability, this primitive ancestor to modern electronic games was a
best-seller in its time.

A few years later, in 1977, the VCS (later designated the 2600) system
was released. With removable joysticks and/or paddles and a variety of
games available on cartridge, this system stormed the United States,
setting sales records that wouldn't be broken until the Nintendo
Entertainment System in the late 1980s. In addition to the Atari
games, companies such as Parker Brothers and Activision also developed
and marketed games for the 2600 as well as the Sears version of the
system, sold under license from Atari.

In 1979, Atari responded to the success of the Apple II and Radio Shack TRS-80 computers by releasing the Atari 400 and 800 home computers. Originally sold with just 8K and 16K of memory, respectively, and a cassette tape storage system, the two computers were based on the 6502 microprocessor, the same chip as used in the Apple and Commodore 64 machines. But the Atari computers were designed to use enhanced graphics, including 256 colors, by use of a separate graphics processor.

The 400 had a membrane keyboard, making it useless for touch typing, while the 800 had a regular keyboard. Both were upgradable to 48K of RAM. Soon, floppy disk storage systems became available for both computers, along with printers and modems, making them complete home computer system. Both Atari computers could also use televisions as monitors.

Both the 400 and 800 had cartridge slots for running cartridge- based software, although these carts were different from and incompatible with the 2600 game machines and subsequent game machines. In addition, the 800 had a second "right-hand" cartridge slot for future development, although few -- if any -- applications for it were ever released. Both computers could also use the 2600 joysticks, and had four joystick ports as on the game machines.

After Jack Tramiel left Commodore in the mid-'80s and purchased Atari from Warner Communications (who had purchased it from Bushnell shortly after the development of the 400/800), Atari upgraded the 8-bit computers with the XL variants. The XLs featured more memory (up to 64K), a different operating system than the 400/800, built-in BASIC, only two joystick ports and a sleeker case. Early XLs (600, 800 and 1200) had compatibility problems with the 400/800 software, crashed too often, and few were sold.

Atari also released the 5200 game machine as a replacement for the 2600 around this time. But the new machine couldn't use 2600 cartridges at first (an adapter was later sold) or joysticks. In addition, the graphics weren't much improved over the 2600 and not nearly as good as the 400/800. As a result of these problems, the 5200 never sold well either.

By around 1985, when the XE (65XE and 130XE) machines were released, Atari had ironed out most of the OS problems and all Atari 8-bit software, cartridges and disks, was running on most of the computers. The XEs had even more memory -- up to 128K -- than the XLs, the same built-in BASIC of the XLs and a more modern look tailored after the just-released ST line of computers built around the Motorola 6800 chip (which also drives the Apple Macintosh and Commodore Amiga).

Atari also released a third-generation game machine, the 7800. The 7800, which can still be found, escaped many of the 5200's problems. The 7800 has built-in 2600 compatibility, although it does not support the 5200 cartridges. The 7800 actually allows more colors on the screen at one time than the 8-bit computers, but the resolution is the

same.

Atari even released an XE game system. It was basically a 65XE with a detached keyboard and option keys. A few cartridge games were released, but the system died due to a lack of marketing.

The XL and XE 8-bit computers represented the last stages of 8- bit development in the computer world. They ran at a then- incredible speed of 1.79 MHz, and were probably the most-advanced 8-bit machines ever.

But by the time the XEs were being released, Atari was ready to push its new ST line of computers built around the already- mentioned 68000 Motorola processor. A few years earlier, Tramiel blew a deal Atari had with the Amiga company (founded by former Atari engineer Jay Miner, designer of the Atari 800) to develop a new 68000 computer and game machine, and had to start from scratch when Tramiel's former company, Commodore, purchased Amiga.

Atari then created the ST series of computers employing the same "Windows"-type environment as used on the Macintosh and Amiga machines. In addition, the STs can run Minix, a Unix-like environment from a third-party developer.

The 520ST (512K) and 1040ST (1028K) were released in 1985. At 8 MHz speed and able to address up to 4 megs of memory, the STs were far superior to the IBM XTs and ATs and far cheaper (less than $1,000 for a 1 meg ST) than the Macintoshes. A planned 260ST never made it to distribution, since 260K was not going to be enough with the desktop (TOS) taking up too much memory. The 520ST could be used with a television, while the 1040ST needed a monitor. Both had built-in Midi support and two joystick ports (one is always used for the mouse).

Within a few years, the STfm series was released, offering a built-in floppy drive, which was soon upgraded to double-sided, double density. And almost immediately after the ST was released came the first third-party emulators: devices which could allow the ST to run Macintosh or PC software. Today, several of these emulators offer over 90 percent compability with commercial Mac or PC software.

In 1989, the Mega series of ST computers was released, offering 2 or 4 megs of RAM (Mega 2 and Mega 4, respectively), room for internal hard drives and built-in clocks. In addition, the Megas had 16 MHz CPUs, as compared to the 8 MHz STs. The Megas also had detachable keyboards, while the STs had built-in keyboards. As with the XL 8-bit computers, the Megas offered compatibility problems with existing ST software. In addition, some of the Megas could not have simple memory upgrades.

Released shortly after the Mega machines, and utilizing a new operating system, were the STe (the "e" standing for "enhanced"). The new OS (called TOS 1.4) can be installed on older STs as well, although most current software supports both new and old TOS. The STe and Mega STe machines also offer stereo sound, up to 4,096 colors and

analog joystick input. A 1040 STe runs for less than $500, and a Mega4 STe costs about $1,200.

The Mega STe also allows for editing external video sources, and can read MS-DOS disks, converting the files to Atari format.

In the early '90s, Atari purchased the Lynx handheld game machine (similar to the Game Boy from Nintendo) from Epyx, and that system has met with great popularity.

Atari also purchased the Portfolio handheld MS-DOS computer from a third-party developer, and that machine has also met great success. Although marketed by Atari, it does not support any ST software and is a PC clone-type computer.

Last year, Atari also released its ABC (Atari Business Computers) line of MS-DOS machines, although they are being distributed mostly in Europe and do not support Atari software. These, too, are PC clones.

More importantly, in 1991 Atari offered peaks at the STacy and ST Book portables, both of which do support ST software. The ST Book features a "vector pad" instead of a mouse, up to 4 megs of memory, a high-resolution (640X400) LCD display, and built-in hard drive -- up to 120 megs. Both should be available within months.

Atari's latest and hottest domestically available machine is the TT/030, based on the Motorola 68030 32 MHz machine. While little software from the ST and Mega machines is compatible with the TT, the new machine is available with either TOS or Unix operating systems. The TT can handle up to 26 megs of RAM, has a math co-processor, multiple serial ports and extra graphics modes. In addition, the TT can utilize a 19-inch monochrome monitor. The TTs start at about $1,800.

The TT, Mega STe and ST Book can all access CDROM drives, bringing Atari owners back to the front edge of computer technology.

Rumors for '92 include a 64-bit video game system, a new series of ST computers that may be compatible with the new video game system, and maybe even a TT/040. Also, Atari enthusiasts are hoping for a domestic release of the Atari Transputer Workstation, currently sold only in Europe and running a version of the Unix OS, Helios.

It's great to still see that so many people are still into Atari 8-bit!
Well, I am doing a lab project here at Bucknell for digital electronics and
I need some info. I don't have any of my many manuals here for reference,
so I need to find out how to setup joystick port 2 for output and send the
output. I know it is a few simple poke statements, but I can't remember
which locations. If anyone could please look it up for me, I would really
appreciate it. Thanks a million.

1316. Hard-Drive horror continued...

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-03 19:48:47 UTC
From: A644690C@vax.edinboro.edu
Message-ID: <01GXQSFMBESI9ODID4@vax.edinboro.edu>
Source record: 107178

In a previous post I mentioned the problems I was having with my hard-drive setup... I am pretty sure now that it is the Adaptec 4000a controller. (Though I would still appreciate any suggestions). I tried to format two other drives with no luck. The lights on the drive and controller just light but the stepper motor does not step. I suppose that all of this could be caused by a bad cable as well, but the problem in not intermitant. It's one of those "yesterday it worked, today it don't" kind of things.

Anyway..... If it does turn out to be an Adaptec problem, does anyone have one they want to sell????? Floppies just don't cut it after getting used to (spoiled by) the search path and such in SDX.

Wait wait wait... let me see..

up, down, left, right, fire, ground... that's 6....
paddle 0, paddle 1, ??Volt.... that's 9....

yeah, there are nine.... two are constant "outs" arent they? The two
paddles and fire are constant "ins" and the stick directions are
selectable I/O.....

im no electronics major.... but isnt this right?

Ya know what I found.... well, here... just do this:

plug a stick into port 1
select either comp. vs. 2 or comp. vs. comp.

hold down the fire button on the stick (which would normally be player
1's)

whenever player 1 (computer) goes to fire, it goes VERY fast....
actually, constant!

Maybe he was playing as the computer and didnt know it? I did that one
time :)

If I am not mistaken, did not Atari sue Commodore over the issue
of just who owned the Amiga?
I was under the impression that the Amiga Lorraine was to be
Atari's baby, but somehow Commodore pulled a fast one.

Can anybody here give the _real_ story and not just hearsay?

> from Warner Communications (who had purchased it from Bushnell shortly
> after the development of the 400/800), Atari upgraded the 8-bit
> computers with the XL variants.

Wrong. The XL series of 8-bit Atari computers was developed under
the old Warner owned Atari. It was an attempt to reduce the cost
of producing the 8-bit machines so Atari could lower their price
to compete with the C64.

> Atari also released the 5200 game machine as a replacement for the
> 2600 around this time. But the new machine couldn't use 2600
> cartridges at first (an adapter was later sold) or joysticks. In
> addition, the graphics weren't much improved over the 2600 and not

Again the 5200 was developed by the Warner owned Atari and it was
nothing more than a redesigned 8-bit Atari computer and used all
the same chips and had exactly the same graphics capabilities.
Atari boneheadedly moved the memory locations of the chips in the
5200 and changed the pinout of the cartridge port so that 400/800

game cartridges wouldnt run on the 5200.

At one time there were no less than 3 versions of every game Atari
put out, the 400/800 version, the 5200 version and the 2600 version.
Retailers were none too happy having to carry 3 different versions
of the same game. Developers also werent too happy to have to rewrite
and repackage 400/800 games for the 5200 when they wouldnt
have had to if Atari hadnt changed the pinouts of the cartridges
and the memory locations of the chips in the 5200.

> Atari also released a third-generation game machine, the 7800. The
> 7800, which can still be found, escaped many of the 5200's problems.
> The 7800 has built-in 2600 compatibility, although it does not support
> the 5200 cartridges. The 7800 actually allows more colors on the
> screen at one time than the 8-bit computers, but the resolution is the
> same.

Yet again the 7800 was developed by the Warner owned Atari. They just
never got it to market in a big way before Warner sold the home game
division and home computer division to Jack Tramiel. Jack didnt want
to spend the money to tool up and properly market the 7800 even though
it was a better machine (100 sprites, anyone) than the NES. Instead
he tried to recycle the old 8-bit computer technology which had long
since been paid for and came out with the XE game machines.

> In 1989, the Mega series of ST computers was released, offering 2 or 4

> while the STs had built-in keyboards. As with the XL 8-bit computers,
> the Megas offered compatibility problems with existing ST software. In
> addition, some of the Megas could not have simple memory upgrades.
>

More misinformation. The Mega STs came out in 1988 and were exactly
the same as the regular ST except for the clock, the detachable
keyboard and a pseudo expansion slot. They did not have 16mhz CPUs.
The Megas ran at 8 mhz just like the regular STs. They also did not
come with the capability to use an internal hard disk. 3rd party
companies found a way to hack them in. As for the memory upgrades,
no ST model before the STE offered the ability to perform memory
upgrades. A lot of 3rd party companies came up with hacks to allow
this.

> In the early '90s, Atari purchased the Lynx handheld game machine
> (similar to the Game Boy from Nintendo) from Epyx, and that system has
> met with great popularity.

Atari didnt purchase the Lynx from Epyx, they got it when Epyx defaulted
on some loans that Atari had made them.

> Last year, Atari also released its ABC (Atari Business Computers) line
> of MS-DOS machines, although they are being distributed mostly in

> Europe and do not support Atari software. These, too, are PC clones.

Atari canceled its line of PC clones over a year ago.

> More importantly, in 1991 Atari offered peaks at the STacy and ST Book
> portables, both of which do support ST software. The ST Book features
> a "vector pad" instead of a mouse, up to 4 megs of memory, a high-
> resolution (640X400) LCD display, and built-in hard drive -- up to 120
> megs. Both should be available within months.

No more than a handful of either machine was ever produced and both
have now been canceled.

> Atari's latest and hottest domestically available machine is the
> TT/030, based on the Motorola 68030 32 MHz machine. While little
> software from the ST and Mega machines is compatible with the TT, the
> new machine is available with either TOS or Unix operating systems.

Quite a lot of ST software will run on the TT and Atari Unix was never
released to the general public. Only a handful of copies of the Unix
OS were released and its now been canceled.

> Rumors for '92 include a 64-bit video game system, a new series of ST
> computers that may be compatible with the new video game system, and
> maybe even a TT/040. Also, Atari enthusiasts are hoping for a domestic
> release of the Atari Transputer Workstation, currently sold only in
> Europe and running a version of the Unix OS, Helios.

Again only a few ATWs were released and those were never available in
the US. The ATW has been canceled.

I have nearly the same setup as you only with a 30meg rll and
4070 Adaptec controller. Do you have a fan in your hd case?
Use a soft gum eraser on the card edge cable connectors.
My MIO has been on since 1987 (unless there's an electrical storm)

I dont turn it off--there's no moving part to wear out.

New at the Archive in the 8bit/New section.

Program name: Mule (com & exe)
Author: Rick Cortese
Fee: none set by author

Have you ever wanted to transfer a file from your 1050 to your IBM, or how about the other way? If you've read the Internet news for any length of time you already know about such programs as "Sparta Read" and "Util". You've also most likely heard about the "Sio2PC" interface that allows you to save files to your IBM hard drive in disk image format. Sparta Read and Util both require you to have double density drives. Sparta Read will work on any IBM drive as the disk must first be formated double density under SpartaDos on your 1050. Util seems to only work when the disk if formated on an IBM 360K drive and read or written to from a double density 1050.

Ah but what if you don't have a double density drive and you don't want to save in disk image format? Yes, there is always the Null modem cable but what if your IBM is not near your Atari? This is where Mule comes in. Mule is a set of programs, one for your Atari (Mule.com) and one for your IBM (Mule.exe), that allow you to transfer a file between any IBM and any standard 1050 disk drive. That's right, double density is no longer required.

How it works, you format a double density disk (do not use high density) on the your IBM, be sure to format the disk for 180k (read your IBM Dos manual of use one of the many 3rd party formatters). Next you copy the file you want to transfer to a second disk (Mule will only read and write to D1:), select read from the menu and wait until told to insert the Mule disk. It works much the same on the Atari side, format the Mule disk, copy from the default drive and write to the Mule disk. Once written, you take the disk to your other machine, load the correct version of Mule for the machine you'll be using and select read from the menu. After the file is read, you'll be prompted to insert a default disk to write to. Mule has been tested on text, binary and archive files and all files survived the transfers.

Okay, the drawbacks. You can only transfer one file per disk, and the file loses its name in the process. Mule always writes a file named Mule.dat so you'll have to remember the name of the files you transfer. The other drawback is that you're limited in file size, about 24k, the author states that there is no reason that the program could not be modified to handle larger files (34k). File size is limited because the complete file to be transferred is stored in memory, there are no multiple read and writes.

One thing to note, Mule is really just a demo to show that such a transfer can be done and as such the program has not really been fully

developed. Still, it does everything it sets out to do and does it well. If you've been trapped by not being able to transfer files from your IBM to your Atari because of a lack of double density drives, then you'll want to give Mule a try.

Included with the archive are the source codes for both the Atari Mule (written in Action!) and the IBM Mule (written in Turbo C). Action! and Turbo C are required to compile modified versions of the programs.

Get the Macroassembler from Thorsten Karwoth, it makes use of expanded
RAM and it's shareware (I think). At least you can get it for
about 20DM. (devide through 1.7 and you'll have the price in $s)

Maybe Peter Staif could give you more details. Peter, don't you have
this assembler?

Marek

>encoding. Coupled with the fact that the directory structure is a
>linked list, practically the entire disk has to be read every time you
>want a directory.

You sounded like a man than knew what he is talking about. Right up to the
point where you said that the Amiga has to read practically all the disk
when you want a directory. The directory is hashed, this makes the seek
a lot faster than scanning the entire disk. Only 512 bytes of data is stored
for each filename unless it is a massive file. Traversing this is very quick
as usually only the tracks near the root block need to be searched. It is
very unlikely to see file information more than 10 tracks from the root block.

Also the blitter is used to decode the track data *not* the 680x0. This makes
is very fast. Far more versatile than the outdated WD1771 could evedr be.
You can have the best of both worlds - MFM and GCR.

Steve.

What are you on about?
According to the Hardware Manual, appedix C connections are as follows:
pins 1-4 - joystick
5 - B pot
6 - trigger
7 - +5V
8 - ground
9 - A pot
^^^^^^^^^^^

Several other books confirm this. That`s how the paddle controllers work
by using the A and B pot lines, after all a paddle is basicaly a 1 Meg pot
with some fancy casing :-)

With my ST mouse connected the following results are obtained using
?PADDLE(0)
right button not pressed = 6
right button pressed or mouse not connected = 228
This works on my 800XL, 65XE and 130XE!

1343. Directories, Hell... ugh

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-04 14:19:46 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <NB513B2w165w@cyberden.sf.ca.us>
Source record: 107203

Last night I got WAY into my little project I've been experimenting with,
MacIshTosh (which btw will REQUIRE a RAMDisk or HardDrive, otherwise
you'll be waiting HOURS!!!)... it works like this

your directory:

AUTORUN.BAS (It's TBXL at the moment)
DEFAULT.DAT (If you want different repeat speed, click sound, colors...)
FONT.FONT
DeskTop <dir>
PROG.BAS
WHERE.DAT
Controsl.Dir <dir>
SetUp <dir>
PROG.BAS
WHERE.DAT
Clock <dir>
PROG.BAS
WHERE.DAT
....etc.

Each program uses its own directory, and has the following two files in
it(s directory), for example
PROG.BAS the program
WHERE.DAT keeps all relative data to let itself know where you were
before you swapped. It is DELETED when you QUIT, but when you select the
menu at the top called "Swap" (which gives a directory list of all
directories within "controls.dir") or "Task" (which shows you what is
being used (hasnt been quit yet), aka a dir of all directories who have a
"WHERE.DAT" in them (remember they get deleted on QUITING only!))...
ahem, when you select a file from Swap or Task, the WHERE.DAT is updated.
Then, if you were to say: start at desktop (automatic), then Swap to
Clock, then Swap to Setup, then Task to Clock and Quit, you'll be sent
back into Clock.... supposedly... it's getting hard to handle. Maybe
I'll just stick with extenders.. like "ACC", "ACD" (DAT), etc.. then when
you select the Task menu you'll see all of the "ACD" files (who have the
same NAME (8char) part as their "ACC" mothers...

Or maybe I'll just kill the project.

> Does anyone have a copy of Miner 2049'er they would be willing to part with?
> I can't find this game anywehre.

I have a copy, but I won't part with it. The real question is does anyone
have a copy of 'Bounty Bob Strikes Back' that they are willing to part with?
I'll buy that one! It is a lot harder to find. I think the problem is that
anyone that has a copy that they would be willing to part with no longer uses
their Atari 8bit and won't be reading this newsgroup. Good Luck...

Do Newell still give new 800-XL's with 256K already installed, for $150?
They used to do that in 1986 or so, is it still on?
Also, do they also have a similar upgrade for 130-xe?
What's their address? What are the prices?
-Itay
P.S. - Please reply directly to ME - I don't read much of c.s.a.8.. Thanks!

Here's a helpful Star Raiders trick that I haven't seen anyone else mention:

If you get really shot up, to the point where your engines no longer work, you can still move, by repeatedly engaging/disengaging Hyperwarp in short bursts. You can actually even dock at a Starbase if you're REAL careful.

For what it's worth, I have ALSO had *UPS*, of all people, refuse to deliver a package, and return it to me, when it developed that the recipient was not listed in the telephone directory on the receiving end. They had the package, and the address for delivery, and could have driven there and LEFT the package -- they'd already been PAID for it, after all -- but they didn't do that, just looked in the phone book (the recipient was unlisted), decided there was no such person, and sent the whole package back to me. The phone companies ought to mention this when they advertise the advantages of an unlisted number, if in fact they do so advertise...

Something else that may be of interest. I have heard that Chuck
Steinman of DataQue has written a fairly complete ANSI C package and
has it as a cartridge. he is not selling it. Maybe with
enough people and $$$, we can convince him to burn a run of
cartridges.

>that's about the upper limit). It is possible to get SCC1 by docking four
>times, but then you really had to push your energy to about 1,500 or so before
>you docked again...
1500? hey I don't start to worry until I get below 900 :-) I've also done the
game in under 8 stardates. However after finishing the game you're stuck
in the front/aft view and I can't seem to find anyway of going back to the
Gal-map to check on the exact time it took me. Does anybody know if there
is a way of doing this?

>:However is you lose your engines or computer then you just tend to waste
>:so much time engaging the enemy that it`s better to dock an get them fixed.

>
> You can get around the engines being destroyed by hyperwarping into sectors,
>blowing up one or two enemies then going on to another sector. No need to waste
>time hunting down the others, since you can just warp into the sector again
>later.
I know that too, but in Star Raiders time is money, all that warping wastes
time not to mention energy, much better to just get the things fixed again,
you can just warp in, dock, and be out again real quick. It is also
possible to use the warp engines to move around in a sector, just warp and
then abort before you jump to hyperspace, this is quicker and uses up less
energy for engaging targets if they're a long way away than using your
normal engines (impulse engines?).

> As for the computer, it's really just a useful tool, rather than an essential
>one. You can track the enemies (with long range) manually, and besides it's
>kind of a challenge to go through hyperspace eyeballing the center of the
>screen... =) =)
unless of course your long range is down as well (I know you can still track
the enemy with it damaged, but not destroyed) :-)
I agree with you about the computer, but again you're just wasting time!
If you're realy all that good you shouldn't get hit more than a couple of times
anyway, so just dock and get the things fixed, one less thing to worry about.

About that article on Star Raiders mentioned in another posting:

Yes please, grovel, grovel, grovel, do

1353. Clearance sale -- updated stock list

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-05 10:08:24 UTC
From: djg0@aber.ac.uk
Message-ID: <1993May5.100824.19188@aber.ac.uk>
Source record: 107112

***** MEGA DEALS *****

Call me crazy if you want, but I have a lot of old stock items I really must clear out of the way NOW! This stuff is all brand new stock, and is boxed&sealed where applicable. The following prices include shipment costs to the US!

BALLBLAZER on ROM cartridge. Brand new, boxed and sealed. I have 1 of these to clear at just $10 each, which includes shipment to the US! (UK price: 4pounds). **only ONE left folks!**

POLE POSITION on ROM cartridge. Brand new, boxed and sealed. I have 4 of these to clear ar just $10 each, which includes shipment to the US! (UK price: 4pounds).

**** SUPER DEAL **** Buy BALLBLZER and POLE POSITION together for just $15 the pair, including shipment to the US! (UK price: 7pounds).

ATARI MACRO ASSEMBLER DISK. Brand new, boxed and sealed. Disk and 2 manuals. I have 8 of these to clear at a stupid $12 each, including shipping to the US (and the boxes are big and heavy!!). UK price: 6pounds.

DIGI-STUDIO packages 1 and 1.5 sets. These are the old versions of Digi-Studio, the digitized sounds and music utility. This pack will get you the keyboard player (to play tunes using the keyboard with digitized sounds) and a tune player to play music in digitized sounds. Loads of samples and tunes are included. You also get a utility to play the tunes in your own programs and a utility to edit samples. Great fun! These used to sell at $20 the set, but now the new full version of Digi-Studio is available I have to clear 10 sets of the old versions. You will get 2 DS disks and 2 typeset booklet style manuals for a silly price of just $5 which includes shipping to the US! UK price: 2pounds. THIS IS A BARGAIN!

EASY PROGRAMMING FOR THE ATARI MICRO book. A highly regarded British book covering many aspects of the Atari and computing in general. Still in publication, and usually sells at 6pounds in the UK. I have about 7 of these left and you can have them for just $7 each, including shipping to the US! (books are heavy, so shipping costs more!). UK price: 2.15pounds.

THE 600XL PROGRAM BOOK. Another good British book full of good type-in programs for all Atari 8bit machines. Usually costs 5pounds in the UK, but I have 5 to clear at just $6 each, including shipping to the US! UK price: 2pounds.

HOW TO ORDER:
This is easy! I accept payment in cash in US$. Just send the cash with your name/address and order to me at:

DEAN GARRAGHTY
62 THOMSON AVE
BALBY
DONCASTER
DN4 0NU
ENGLAND

IF you are sending a large amount of cash, you may like to pay for international insurance on your letter when you send it. I can't be held responsible if your cash goes missing!

Please Email me first to reserve stock: djg0@aber.ac.uk.

Well keep in mind, I'm telling the story through my memory which is
heavely slanted towards the US, since I live here. I personally have only
seen 1, count them, 1 ST (a 520). Apparently they were a big hit everywhere
else. Especially in Europe.
>

Well, there isn't a whole lot to say about it. Its still in production and
I could add details like what it came with but thats it. As for the Falcon,
its not available here yet in the US and I really doubt if anyone I know is
going to get one so i can look at it.
But once its in wide release I'll add something about it..

At this moment, my new outline of ATARI history is about 5 pages long. when
I get some time, I'll run it through a spellchecker and gramer checker and get it all
cleaned up..

>
>(Oh, and I guess the couple of ATWs that were sold should also get a mention)

OK, I'm gonna take the flame bait hook, line and sinker.

$50? You gotta be kidding. I quick perusal of the American Techna-Vision ad in the current issue of Atari Classics lists Archon at $12.50 and Star Raiders at $5.00, for a grand total of $17.50 plus shipping. Hmph, $50 indeed. Obviously a blatant attempt at making money and ripping somebody off in the process.

Wait, wait... Phffft. Ah, that's better - I managed to spit out the hook. Sure glad I didn't take that flame bait. :-)

1359. Re: Joystick Port Setup for Output

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-05 17:11:18 UTC
From: JJMCWILL@MTUS5.BITNET
Message-ID: <93125.121118JJMCWILL@MTUS5.BITNET>
Source record: 107131

James,

What you need to do is get technical information on the 6520 or 6521
or 6820 PIA chip. That is what controls the Joystick ports.
$D300 is PORTA, which handles the joystick inputs/outputs

bits 0-3 are stick 0 and bits 4-7 are stick 1

To configure the port, you need to set up PACTL, which id $D302

From: Jeff_M_Lodoen@cup.portal.com
Message-ID: <80899@cup.portal.com>
Source record: 107122

The original poster did specify CARTS, and I don't think ATV is selling the cartridge version of Archon for $12.50 [disk version, yes].

Star Raiders at $5 is about right, no docs or box though.

Why don't you ask in comp.sys.AMIGA.emulations?
Now for my question.
Can a 520 ST be expanded over 1 MB? I would think so, since the 68000 can address over 1 meg. Also, can the ST's use a more advanced 680x0chip? Will it work with a multiscanning monitor? If I find a used one in the paper I'm tempted to buy it. I'm bored with my present machine.

This is ridiculous, The AmigaDOS OFS format is one of the most secure formats in existance.

On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors per track, how outdated can you be?

Yeah,

I have an Atari 130 xe, with a 1050 drive, along with a 300 baud modem, an
that old 1010 tape recorder, and a Taxan color monitor. I am interested in
selling these items for what I can get for them. Everything is working in a
great condition, my brothers still play games on them. I am going to school
in Bethlehem, PA and live in north NJ. So, if your interested make me an
offer.

It is some what dependant on how you program. If you're the type of guy who maintians a data base of all your relatives birthdays, have all your canceled checks going back to the middle ages, & own a closet organiser, the The Big Mac's for you! The main reason for using a macro assembler is because you have all your routines defined as macros & keep them on a disk as a file to be included when you program. You can define macros like: GRAPHICS 8 that will assemble to M/L so your source programs end up looking equivalent to BASIC. IMO: If you don't use the macro ability, it's pretty much a waste of money because of what you loose in the memory map (i.e. bottom of page 6, etc)

My ST can fromat from 360K to 1.66MB per floppy, depending on the
Tracks/Sector combinations... IBM can't read 'em all... ;)
However, most people will agree that the IBM is almost the standard in
disk format (I mean most programs/data are written on them!) WHY would
you want a different format unless you were planning on living under a
rock and not exploring the world! (My friend uses my ST to sector-edit
his IBM files and games).

Besides, one format makes life easier for Software Developers and
programmers alike.

Every once in a while we do swap information with people that own clones, and in that area you must have 9 sectors per 720k disk and 18 sectors per 1.44meg disk. But I normally format my disks with more than the standard number of sectors and tracks. This nicely provides security from an IBM user taking stuff snooping around my collection of disks at work. :)

I can read all of his 3.5" disks but the same is not true.

The same reason you waste .5k per file, you have to store the directory
information someplace. Granted the Amiga method is more efficient for floppies
with few files on it, but it is not interchangable with other micro processors
platforms.

|> How can a system that only handles one disk-format (IBM) be superior to a
|> system that handles numerous (including IBM) ?

Please define numerous. Are you referring to MFM and GCR, which is two
physical formats. Are you referring to the ability to handle more than
IBM 360k, 720k and 1.44meg formats, which is also more than 1 format.

How about the following:
Capacity Sides Tracks Sectors
360k 2 40 9
364k 1 81 9
368k 1 82 9
360k 1 80 9
400k 1 80 10
404k 1 81 10
409k 1 82 10
440k 1 80 11
444k 1 81 11
449k 1 82 11
720k 2 80 9
728k 2 81 9
736k 2 82 9
800k 2 80 10

808k 2 81 10
816k 2 82 10
880k 2 80 11
888k 2 81 11
896k 2 82 11
1440k 2 80 18
1449k 2 81 18
1458k 2 82 18
1520k 2 80 19
1529k 2 81 19
1538k 2 82 19
1600k 2 80 20
1609k 2 81 20
1618k 2 82 20

Now if you consider all these as formats, then Atari's support a lot more than 1 disk format under TOS-2.06. TOS 1.xx does not support the HD drives without add-on software. If you do not consider all these as formats that is your perogative, but please be a little more specific in the future.

With the add-on hardware of Spectre GCR all GCR coded disks are available, though no one has bothered to write a driver to decode Amiga disks. (The corallary to the old law of supply and demand: if there is no demand why bother to supply)

|>
|> What so great about CRC when it doesn't prevent write-errors?
|> Just wondering.
|>
|> NjE
|>

It will let you know that when you wrote to the disk that there was a media error and you can change disks and rewrite your file, so you do not have bad backups. It will also let you know if your disk has been corrupted since you wrote it. Typically I believe it is good to know that you have a problem with your media. Though you can disable write verify on your floppies I do not recommend it.

oooooo...I'm so impressed. Eleven character filenames, ooooooo! :-)
Standard IBM format is NOT better than anything the Amiga has... time to
use your Comp. Eng. knowledge to find out about it. OFS, FFS, DCFS...
any meaning to you?

No, but the Amiga can format, read and write MS-DOS (and, of course, ST) disks.

He's referring to the ability of reading PC, ST and native Amiga disks (DD and
HD). Plus of programming your own sectors/track, tracks/disk *yawn*

[...]

Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
necessary, simply by adding a new device handler. I'd assume it can read all the
formats you mention (since they don't rely on variable-speed drives, and are all
MFM-encoded). Plus, of course GCR blah blah blah.

> With the add-on hardware of Spectre GCR all GCR coded disks are
> available, though no one has bothered to write a driver to decode Amiga

> demand why bother to supply)

Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST
disks very simply, why would you want to have some complex hack to allow the ST
to read/write Amiga disks?

> |> What so great about CRC when it doesn't prevent write-errors?

shrug again, I've never had a problem with lost files; I did have a screwed-up
disk once (no-name cheep one... Never bought those again :), and the OS returned
a "Disk screwed. Waste it" message. So what's the big deal?

The latest version of the SpartaDos X cartridge is supposed to be able
to use the Syncromesh speed. The latest version of DOS XL uses it as
well. I had the address and phone number for getting the updated DOS XL
a long time ago. I would have to look them up again.

Later,

Itay,

You need the new version of DOS XL, and the GTSYNC.COM or some
similarly named file to get synchromesh working.

>yeah... that's the ticket...")

Yes, you can make unlimited backups for personal use. However, and I
bring this up only because it is coincindetally relavant here, it is
questionable whether or not a company can make a transient copy -- even
in RAM -- for the purpose of commercial gain.

This came up in Sega v. Accolade. Accolade wanted to make cartridges
for the Genesis without having to pay for the "Sega Seal of Approval".
So they had to reverse engineer a Genesis cartridge by disassembling the
machine code. The courts originally ruled that this transient copy (the
disassembly!) constituted a copyright violation. It was thankfully
overturned recently.

For a better discussion, see issues of IEEE Computer for the past year.

>it without the OS and tell people how to get the OS out of the 8-bit and into
>their ST.

As the original poster said, the translator disk was released to the
public. It was distributed freely through BBSs. Atari assumed that it
would be useless without an Atari 8-bit computer, and there was no
license that the downloader had to agree to before downloading (as there
is when downloading Amiga OS patches from CompuServe). So if a BBS
can distribute the Translator disk, why can't Derek?

APAC mode is an 80 x 96 x 256 (Horiz. by Vert. by colors) mode which uses the Atari 800, XL, XE (MOST 800's, that is) GTIA chip which has an 80 x 192 x 16 grey mode as well as the same but in color .. it then alters the mode of each line down the screen to give you what is really 80 x 192 x 32, because every other line is the first mode, then the second, then the first, etc... but when blended (it vibrates the screen to blend) it looks like (actually, to the TV and your EYE it IS) an 80 x 96 x 256 mode.

THEN there's APAC Interlaced, which is 80 x 192 x 256 and it uses the same blending.

THEN there's Pryzm, which is 80 x 192 x 256 and it uses page flipping.. so all it really is is strobing the screen between the two modes... full screen swapping... sorta ugly..

THEN there's APAC 2 which is really APAC, but I redesigned the display list such that drawing on the screen is a cinch.. all you do is (from BASIC, for example..)

```
COLOR color
PLOT X,Y
DRAWTO X2,Y2
COLOR brightness
PLOT X,Y+96
DRAWTO X2,Y2+96
```

otherwise it's hell!

THEN there's ColorView9 mode, which is sorta like APAC but rather than blending a color screen with a brightness screen, it blends a red screen with a blue screen with a green screen (sorta like the TV does!) to give you a whopping 80 x 192 x 4096!!!

THEN there's ColorView15 mode which is the same as 9 except it uses Graphics mode 15 (aka "7.5" or "7+" from the good old days).. .it uses 160 x 192 x 4 screens blended together to give you 160 x 192 x 64 colors ... rather than 3 80 x 192 x 16 screens giving you 80 x 192 x 4096..

(4^3=64, 16^3=4096)

whew1

Is there a program that will allow me to format and copy information to
disks readable by my Atari 1050 using my IBM?

Help!

] >On a related note, Why do ST's waste 160K per DD disk? I mean, 9 sectors
] >per track, how outdated can you be?

PC's use 9-sectors, they are hardly outdated!

I can quite happily format 1 to 11 sectors per track (inclusive)
1 to 82 tracks per disk (inclusive)
1 or 2 sides per disk!

So, I can easilly format my disks to over 900K!

] No, but the Amiga can format, read and write MS-DOS (and, of course, ST)

Not without additional software though!

>
>No, but the Amiga can format, read and write MS-DOS (and, of course, ST) disks.
>

Next time you log on, please remember to plug your brain in. You (and other Amigoids) seem to make a whole point about how you have an OS that does it all for you ... well, I'll tell you what : It stinks !!
You can read ST/DOS disks ? well so can *ANY* computer that can read a floppy. Just because those who wrote the OS thought of a specific way of representign the data, does not mean the entire computer must work with that. If I knew what the disk format was on the Amiga, I could write the driver myself. Sure, it'll be slower because I won't be using specific hardware, but it'll work just the same.
The fact that the OS does everything goes to show how incompetent you guys are in writing software. If commodore didn't put it in, then no one will !
What a strange way of thinking ...
And disk formats isn't the only thing like that. Just take the 4096 colors you guys always brag about. Well, if on my ST (Which allows only 16 colors out of 512) I can display 512 colors anyways, why don't you try having those 4000 colors without using what's provided to you. go into the lower modes, and try to write something that will allow you to have more colors and/or lines. Could YOU write an overscan for the amiga, or is setting your video controler to that pre-chewed mode the only thing you can do ?

So please, if your computer does more, it's not because it's better. It's just because others have thought it out so your poor mushy brain won't have to. Hardly anything to be proud about.

>Sure, but the Amiga can be programmed to read more/fewer tracks/sectors as
>necessary, simply by adding a new device handler. I'd assume it can read all the
>formats you mention (since they don't rely on variable-speed drives, and are all
>MFM-encoded). Plus, of course GCR blah blah blah.

wow ! what an achievement ! getting a controlleer that can access X sectors to read less than that ! Gee, you sound like a genius ! Care to tell us how to obtain such greatness ?

>Amiga disks are MFM coded. And, of course, since the Amiga reads and writes ST
>disks very simply, why would you want to have some complex hack to allow the ST
>to read/write Amiga disks?

Again, why do you think it can read them ? because the "complex hack" has
been dne by people who knew you'd be incapable of doing it yourself.

>*shrug* again, I've never had a problem with lost files; I did have a screwed-up
>disk once (no-name cheep one... Never bought those again :), and the OS returned
>a "Disk screwed. Waste it" message. So what's the big deal?
>

Never did I. But maybe if you had the check, then you could have known
before the entire disk was good for the trash bin, and saved everything
except the last one written (The one that screwed things up).

Patrick.

1400. Re: Joystick Port Setup for Output

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-07 03:07:29 UTC
From: generic@rahul.net
Message-ID: <C6MzCI.MBs@rahul.net>
Source record: 107150

As you know, the joystick ports are actually Parallel I/O chips. They have been configured by the operating system to read only. The address of Joystick ports as mentioned in a previous message is $D300. This address serves two registers actually. When bit 2 of PACTL ($D302) is 0 it points to a "direction control register". Each bit in the "direction control register" corresponds to a bit in the joystick ports. When a bit is set to 0 the computer can read values from that bit (normal case of a joystick. When the bit is set to 1 the computer can write values to that bit. The normal case is all zeros. Since you only want to use one joystick port then you will be limited to four bits individually configurable to input or output. In summary:

1) Set bit2 of PACTL($D302) to 0
2) Set bits 4-7 of PORTA($D300) to 0 for input and 1 for output
3) Set bit2 of PACTL($D302) to 1
4) Perform input and or output

That's a good question. I guess when you first release a machine
using parts that are off the shelf and easily cloned, you've probably
got the most popular machine in the world, esp. if your name at the time
was IBM. "Hey, I think this thing can be used for business..."

Hello,

A friend of mine is looking for the following ATARI-electric
circuit scheme's:

The drawings of the 600 xl
The drawings of the daisywheel printer (1027 i believe)
and any additional scheme's which are available.

I was wondering if they were online somewhere (ftp). Or he can get
them some other way.

Any help would be appreciated,

Gerco Ballintijn (bcballi@cs.vu.nl)

PS: Please Email responses.

First, I think this topic has gone too far. I personally feel that
it does not belong here. Please take it to the .advocacy group.

Secondly, I personally do own an Commodore A4000/040 as well and I
find your generalization of "Amigoids" as people who takes prides
in havind "OS that does it all for you ..." as being rude. Maybe another
Commodore user had started the whole argument, but who knows by now.

As I said before, I think this topic should move on to
the .advocacy group COMPLETELY now.

I may not be right on this one (so no flames please), but i belive that Mac disk drives spin at different speeds depending on where the disk head is (ala CD-ROM).

If it was MFM or GCR the Amiga would be able to read it.

Source record: 107065
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Well, I think I should apologize for my previous post. I was not quite
aware of the kind of people I was refering to.
After many hours of wondering why they even bother posting here, I decided
to make a little trip down to their place : comp.sys.amiga.advocacy.
It was, how should I say ? weird. Yes, just plain weird. There were a number
of threads (Not too many). The main one was debating between the Amiga and
PC's, almost along the same lines as here. Another was criticizing the QUERTY
keyboard, and others were comparing "old technology" with the new one
(Like the PET and C64 !!). Others were wondering who in their midst will be
the last one to post on their group. One even posted an article (Subject :
Amiga is #1) and says quite frankly that he posted it so it'll start a new
flame thread, and behold ! It's working !!
But one thing that *really* shocked me, was to see that there was no thread
on the ST! Sure, it may be that during a Amiga-PC debate, one would go "Oh,
and the ST sucks by the way" out of nothingness, but there were no major
attacks. So, we just happen to have amongst us those frustrated ones who
feels they cannot let a platform untouched by them.

I'm sure not all Amiga owners are like that. I know some who are very aware
of what the different systems can and cannot do, including their own. I
think we're just unlucky. I mean, here they are, posting in our group about
how their new A1200 (Which came out when ? less than a year ago ?) with
our 520ST (First released back in '85, so the design is even older).
They might as well be comparing the ZX81 with the latest from SUN. Has
anyone noticed that they *never* flame about the TT, just because they know
it's more powerful than the ST, and thus they can't say much bad about it?

And I will reiterate my previous post saying that the power of a computer
is not the same as that of the OS it has. I totally agree the ST's desktop
sucks real bad, but there are alternatives. If your Amiga OS allows you to
read all disk formats, then good. Ours doesn't simply because we never needed
it, and so no one ever wrote anything to do so. Generally speaking, the
ST does not have as much as the Amiga when you buy it, but it doesn't
mean you *can't* have it, just that you're not forced to pay for something
if you're never going to use it. How many Amiga users run their WP in full
4096 color mode ? OK, maybe they will use it for games, but that's about it.
And if you don't want to play games, you bought an expensive piece of
hardware for no reason whatsoever.
Sure, you'll say "But if we want to use something, we don't have to go
anywhere, because it's already in there". I agree. But on the ST, if you
wanted it from the start, you would have bought the required hardware
along with the machine. And what you don't need, you don't pay for.

I've had my ST for 6 years now, and I still like it a lot. It seems, however, that most Amiga owners feel they have to buy the newest release everytime. Many of you say you've had (And probably still have) the 500, 3000 and now the 1200, plus all the others whose number I don't remember (Why can't Amiga get those number to grow, and not jump up and down randomly).
If the computer had indeed been well made, you wouldn't have to change it every year. No one with an ST (At least no one with a sane mind) would have sold it to get the STe. Not enough difference. Buying a TT or Falcon is another matter. They're way more powerful than the STfm, and thus are good reasons for changing.

Anyways, I'm sick of those wars. They're stupid, pointless, and make it look like all Amiga owners are nerds, when that really isn't the case. Just a couple of them (There are Atari nerds I'm sure, but they keep silent)

Patrick.

I think this sums you up fairly well. What are you doing with an ST? I mean, it has BUILT-IN routines, right? I mean, you wouldn't be caught DEAD calling an AES routine, now would you? No, I guess you'd rather program the 68000 in microcode, using a 5v power supply and pencil and paper (wel HELL what do you want memory chips for?)

> Again, why do you think it can read them ? because the "complex hack" has
> been dne by people who knew you'd be incapable of doing it yourself.

I assume, of course, that when your ST boots up, it uses your own disk loading routine, hand-fed in at boot time by you setting individual bits of memory.

> >*shrug* again, I've never had a problem with lost files; I did have a screwed-up

Are you 100% sure of that? I seem to remember a long time ago (I never get
shot up realy badly nowdays :-) that I lost both my shields and long range,
so to dock I had to keep on warping into the sector until I caught
a glimpse of the star base shoot by on the screen, and then head in that
general direction. I even remember once having to abort the game because I
just couldn't find the base. This was a long time ago however, and it has not
happened to me since. Maybe it happened on a lower level (i.e. not Commander
level). Has this happened to anybody else, or do I just have a dicky memory.

You REALLY need an education. Dynamic hires, SHAM, PCHG, and assorted other display tricks. GO back to your 512 color atari and enjoy your ignorance. If you really think doing everything yourself is such an advantage, why dont you throw out your 1040 or whatever and get an atari 2600... you dont need a keyboard of course, just use the joystick buttons... only incompetent people need a keyboard. duh.

>So please, if your computer does more, it's not because it's better. It's
>just because others have thought it out so your poor mushy brain won't

Whatever dude.

>wow ! what an achievement ! getting a controlleer that can access X sectors
>to read less than that ! Gee, you sound like a genius ! Care to tell us
>how to obtain such greatness ?

Easy, GET A CLUE. Do you know anything about the Amiga's floppy disk system? With all your bragging, I bet you couldn't even write an Amiga MFM disk loader.

>Again, why do you think it can read them ? because the "complex hack" has
>been dne by people who knew you'd be incapable of doing it yourself.

This incompentent tint again. Why do you use TOS? Why not write your own OS, since otherwise you'd be "incompetent".

|> attacks. So, we just happen to have amongst us those frustrated ones who
|> feels they cannot let a platform untouched by them.

Not really, I just read this group to see what's happening as regards different computer systems. Of course, if I see an inacuraccy posted about the Amiga, I'm likely to say something :-)

|>
|> I'm sure not all Amiga owners are like that. I know some who are very aware

^^^^^^^^^^^^^^^

None, HAM is for graphics work, and it's very good at it. (Now does 262144 colours.)

|> And if you don't want to play games, you bought an expensive piece of
|> hardware for no reason whatsoever.

I use mine for wordprocessing, programming, graphics and just because I enjoy using it. I very rarely play games. I don't consider this to be no reason whatsoever.

|> Sure, you'll say "But if we want to use something, we don't have to go
|> anywhere, because it's already in there". I agree. But on the ST, if you

|> every year. No one with an ST (At least no one with a sane mind) would have
|> sold it to get the STe. Not enough difference. Buying a TT or Falcon is

And there was not enough difference between the 500 and 600, or the 500 and 2000, or the 1200 and 4000 to upgrage. Of course, going from an A500 to an A1200 is another matter. They're way more powerful than the A500 :-)

|> another matter. They're way more powerful than the STfm, and thus are good
|> reasons for changing.

|> Anyways, I'm sick of those wars. They're stupid, pointless, and make it look
|> like all Amiga owners are nerds, when that really isn't the case. Just a
|> couple of them (There are Atari nerds I'm sure, but they keep silent)

Oh I don't know. I have met one or two who are fairly vocal. Of course some Amiga owners make stupid statements, but you'll get that in pretty much any group of people.

Ok, whatever.. but your previous post was full of drivel about Amiga
programmers or whatever being inferior because they can't write MFM
disk loaders. What kind of nonsense is that?

>I've had my ST for 6 years now, and I still like it a lot. It seems, however,
>that most Amiga owners feel they have to buy the newest release everytime.

Exactly why people upgraded from the 500->3000->(4000/1200). I'm sure
there are many atari users who went from 520ST->TT->Falcon, or will go
that route.. no difference.

>:the little man will just float around :)
>
> I remember hearing a rumor way back when that you could destroy the robot,
>but I haven't been able to do it myself. Is it possible?

Besides shooting it, you can also chase it after it has finished docking!
Apparently, it goes right through the starbase and beyond.

>
>:P-photons/phasers/whatever
>[...]
>:R-radio (updates map, tells you when a starbase is surrounded or
>:destroyed, etc..
>
> Everything else in the game is expendable except for these two, seriously. If
>either of these becomes destroyed, you better dock, otherwise you keep going.
>(If you *really* want Star Commander Class 1, that is =)

You *REALLY* need that radio in the beginning. Once you've annihilated most
of the enemy fleet, however, it becomes less important.
Engines become more important if you need to chase after space cruisers (the
upside-down v's) because they tend to move around a lot. If you're computer
tracking and sector scans are destroyed/damaged and your engines are gone

AND the you have to deal with a space cruiser, it is best to dock and chase them later than wasting time and fuel pursuing them in that condition, unless it is an emergency.

>
> BTW getting SCC1 was so *hard* that if you docked more than three times, you
>couldn't get that rank. That game *really* made you work for it.
>

Depends on what you consider hard. On commander level, I got it better than 50% of the time. The way they kill you most often is a shot that damages/ destroys the shields quickly followed by a shot which hits you while unshielded (poof!).

SP>
SP> Sam

Sam,

Actually those postings have nothing to do with comp.sys.atari.8bit
This is an ST/Amiga flame war and doesn't really involve the 8 bit at all.
I've gotten pretty tired of seeing this stuff cross-posted, so I've
started sending e-mail to everyone who's continually cross posting to c.s.a.8
to have us removed from their Newsgroups: line so that we can have a little
peace and quiet. One of the things I like so much about c.s.a.8. is that
we've managed to avoid flame wars, and I hope we can keep things that way.
With a little luck we'll see people either quit cross posting to our group,
or the flame war will die out all together.
Keep your fingers crossed.

1432. Alright... i have mule.com. Whats the filename for exe?

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-09 20:59:33 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <y6Va4B2w165w@cyberden.sf.ca.us>
Source record: 107094
Body handling: HTML body converted to readable text

I need the correct name, directory, and case-spelling (mule, Mule, MULE, etc..) for the file "mule.exe" ... or if it's zipped "mule.zip" or whatever

I got mule.com from Jeff L and got it decoded and ready for download to the Atari ... but I'd REALLY like mule.exe so I can get it downloaded to the IBMs on Monday the 10th! (tomorrow!)

Any help would be MUCH appreciated... I dont wanna call AtariBase long distance just to get it.

Hell, I dont wanna call ANYWHERE long distance to get it if it's on the archive! ;)

thanx!

Lance,

Well, I support the effort, but I am skeptical about its success. To my knowledge, Chuck Steinman dropped off the face of the earth as we 8 bitters know it more than a year ago, and hasn't been heard from since. Contradicting rumours have been circulated as to just how complete Chuck's C Language project had gone before he abandoned it. I've heard that it is complete, AND that he gave up after having great difficulty implementing structs and unions and stuff due to the 6502's limited address space, stack space, and code relocatability.

Really, it is on the 'cheat' menu. It is a CTRL command, but offhand,
I too cannot remember it without booting up the game. But it is there and
should work. You can set it up for the computer to play itself.

Actually, the 800 (apparently) also started with 8K RAM. It was also packaged with the 410 cassette recorder and the Atari Educational System Master Cartridge. They later took away the latter 2 items and added 8K more memory. I know this because of a notice in my Atari Manual mentioning the change.

>
[...]

>Both the 400 and 800 had cartridge slots for running cartridge- based

Wasn't "Monkey Wrench" a right-hand cartridge? Plus another cartridge that included a battery-backed clock, if I remember.

Also, what did happen to the STacy (the laptop computer, if I remember)? Last I heard it was being sold to music stores and such and that it actually gained a certain amount of popularity.

Personally I like ATMAS II very well, but there are some people who dislike
it. The main drawback of ATMAS II is that you can't keep more than some 17K
of source-text in memory. The price of ATMAS II is about 49DM I think.

***** MEGA DEALS *****

Call me crazy if you want, but I have a lot of old stock items I really must clear out of the way NOW! This stuff is all brand new stock, and is boxed&sealed where applicable. The following prices include shipment costs to the US!

BALLBLAZER: *** SOLD OUT ***

POLE POSITION on ROM cartridge. Brand new, boxed and sealed. I have 3 of these to clear ar just $10 each, which includes shipment to the US! (UK price: 4pounds).

ATARI MACRO ASSEMBLER DISK. Brand new, boxed and sealed. Disk and 2 manuals. I have 8 of these to clear at a stupid $12 each, including shipping to the US (and the boxes are big and heavy!!).NOTE: This $12 only covers surface mail charges. If you want it sending by Air Mail then the price is $20. UK price: 6pounds.

DIGI-STUDIO packages 1 and 1.5 sets. These are the old versions of Digi-Studio, the digitized sounds and music utility. This pack will get you the keyboard player (to play tunes using the keyboard with digitized sounds) and a tune player to play music in digitized sounds. Loads of samples and tunes are included. You also get a utility to play the tunes in your own programs and a utility to edit samples. Great fun! These used to sell at $20 the set, but now the new full version of Digi-Studio is available I have to clear 10 sets of the old versions. You will get 2 DS disks and 2 typeset booklet style manuals for a silly price of just $5 which includes shipping to the US! UK price: 2pounds. THIS IS A BARGAIN!

EASY PROGRAMMING FOR THE ATARI MICRO book. A highly regarded British book covering many aspects of the Atari and computing in general. Still in publication, and usually sells at 6pounds in the UK. I have about 7 of these left and you can have them for just $7 each, including shipping to the US! (books are heavy, so shipping costs more!). UK price: 2.15pounds.

THE 600XL PROGRAM BOOK. Another good British book full of good type-in programs for all Atari 8bit machines. Usually costs 5pounds in the UK, but I have 5 to clear at just $6 each, including shipping to the US! UK price: 2pounds.

NOTE: The prices for the books only cover surface mail charges. For Air Mail please add $5 to each book.

HOW TO ORDER:
This is easy! I accept payment in cash in US$. Just send the cash with your name/address and order to me at:

DEAN GARRAGHTY up until June 6th, please send orders to:
62 THOMSON AVE 23 YSTWYTH CLOSE
BALBY PENPARCAU
DONCASTER ABERYSTWYTH
DN4 0NU SY23 3RU
ENGLAND WALES, U.K.

IF you are sending a large amount of cash, you may like to pay for international insurance on your letter when you send it. I can't be held responsible if your cash goes missing!

Please Email me first to reserve stock: djg0@aber.ac.uk.

1441. Halle Project / Demo on the archive

Source record: 107100

I know that some of you enjoy watching demos. This time you should
really get the following files from atari.archive.umich.edu
(8bit/Demos directory):

halle93a.dcm
halle93b.dcm
halle93c.dcm

These are 3 sides of this year's 'The Halle Project' demo.
Halle-demo is the continuation of the Hobbytronic series.

I'd like you especially to see the 'plasma-demo' or 'whiggle-demo'
on side 'a'. I bet you haven't seen this effect on your XL/XE before!
I hope you'll be able to run it on NTSC machines as well.

Somewhere else on the demo disks you'll be able to see some digitized
photos showing a bunch of skilled programmers responsible for
these disks. Watch out for other 8bit celebrities as well!!!

The rest of the demo is nothing really revolutionary but still
pretty awesome.

have fun!

Yes, unfortunately. Chuck came on the scene all gung ho for the 8bit
computers knowing that there wasn't a very large market. At the time that
was OK with him because he was really making his money on other projects
and just wanted to support the Atari 8bit, not use it to make a living.
Apparently he found that it would take a lot more time than he was willing
to invest. I used to have his CompuServe address and emailed him a couple
of times but never got a reply.

>it's pretty much a waste of money because of what you loose in the memory
>map (i.e. bottom of page 6, etc)

The main reason for using Mac/65 over the Editor/Assembler is speed (IMO).
The latter is amazingly slow; I'm at a complete loss to figure out
exactly what it is doing. Assembly times seem to grow exponentially as
the size of your program increases. Even Atari admits this in the back
of the manual (something to the effect of "only use this assembler for
small programs").

Mac/65 also has other niceties besides macros: textual error messages
(instead of numbers), more operators and directives, nicer automatic
formatting in the line editor, etc. Minor enhancements, I suppose.
The only big addition is the debugger; it's smart enough to
automatically save and restore some interrupt vectors and shadow
registers, plus lets you break out of a running program with a
keystroke.

Come to think of it, I don't think I ever wrote a single Mac/65
macro...

>
>] No, but the Amiga can format, read and write MS-DOS (and, of course, ST)
>
>Not without additional software though!

Hel-lo??? MS-DOS file reading/writing is *included* with the operating system!!! Do you know what you are talking about?

Anyway, this is all a moot subject. First of all, people (and supposed engineers, no less) are using a very generic term - "disk format" - and are using it in not quite its true meaning. What people have actually been talking about when discussing sectors per track, etc, is more like *DRIVE GEOMETRY* - there are a finite # of drive geometries, and are all hardware dependent. This is what is so baffling. The ST and Amiga use the same #$@#%#$ kind of disk drives, so how can there be any argument here??? Amiga and ST drives at the hardware level read and write exactly the same (MFM) and at the same speed! Okay, so that's settled.

Now, we have the other part of what is all under the generic term of "disk format" and that's the filesystem. Here the two are very different. Each has it's advantages and disadvantages.
Here's what bother's me though: The ST users are trying to defend the fact that they are locked into one filesystem, namely an MS-DOS type filesystem. Why has no one on either the ST or PC ever come out with a new filesystem that allows longer filenames and whatever other nice features you might desire? What is do difficult of writing a new filesystem that reads both the new disks and the old 11-character filename disks? (Beats me.)

Now, for those who love the safety and compatibility of your MS-DOS-type filesystem, there can be no argument against the Amiga since you can easily mount the MS-DOS filesystem on all your HD partitions, all your floppy drives, etc. and you can go on your merry way using MS-DOS filenames for all your files and programs. What seems to be the problem here? How can you criticize the fact that the Amiga allows BOTH filesystems to be mounted on any # of devices simultaneously and will recognize what disk is inserted automatically? If you hate the Amiga FS, just boot it and use the MS-DOS filesystem! No big deal....And you'll *Still* be able to read your friends' Amiga disks with no problems.

Now, I realize the concept of inserting a disk and having the machine automatically figure out what disk is inserted is a foreign concept to ST and PC users (Mac, NeXT, Amiga, and some workstation users are quite blessed with such technology) but that's not my problem, is it?

Case closed.

THEPLAYR.ARC
Author: DAN.KNAUF Date: 900704
Approximate # of bytes: 8820
Description: AMS & AMSII Stereo player
The Music Player plays AMS I or AMS II tunes. If you have a 2nd pokey
installed it will play in 16-bit stereo, 8-bit stereo, or 8-bit mono.
Otherwise you are stuck with 8-bit mono. Up to 69 files can be seen on
the screen. Autoplay, Tag, Untag, and Play Tagged are some of the
options. You can switch modes (16-bit S, 8-bit S, or 8-bit M) while
a tune is playing. The name of the song being played is displayed on the
piano screen.
This is a GOOD AMS player. If you haven't done Chuck's Gumby upgrade yet,
this should give you a reason to. If you are short on AMS tunes, check out
the files in this directory. They should give you plenty of tunes to
play with for a while. Download this file! Docs are included.
This file sent to archive soon to appear in 8bit/Sound dir.

From: tribe831@snake.cs.uidaho.edu
Message-ID: <1smqktINNht@owl.csrv.uidaho.edu>
Source record: 107012

I too was waiting for the release of the TC8 cartridge. I was more than happy to pay the $50 (or maybe even more) for a complete, fast ANSI-C compliler for the Classic Atari.

But, when it didn't materialize, I decided to write one myself. I've written compilers before (with YACC) and have examined the source of serveral others, so I am fairly confident that I can do it. I even have some pretty good ideas for how to implement it efficiently. But, my current design relies on the user having 128K compatable with the Atari 130XE (yes, I'm bootstrapping from my XE-Bank routines and CC65...)

VAPORWARE ALERT: I'm making NO promises of any kind. I'm writing from scratch, and am only up to recognizing valid ANSI C input. No code generation, no relocateable assembler, no linker. Yet.

Also, this is very likely my last week online before the summer, so I'll be incommunicato for three months or more. If I get something useable (hopefully saleable) I'll try to announce it in Atari Classics magazine.

So... you sit there doing dir all day? File opens and other useful operations
are orders of magnitudes faster under AmigaDOS than most file systems.

Also whats wrong with using Directory cached floppy disks?

Dream on idiot. Both machines using DD disks have the same raw transfer rate.

1455. Digi-Studio -- price slashed in half!

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-11 10:46:28 UTC
From: djg0@aber.ac.uk
Message-ID: <1993May11.104628.10112@aber.ac.uk>
Source record: 106961

As you may know, I am the programmer and developer of Digi-Studio -- the digitized sounds and music utility.

At the start of this year I managed to get a distributor in the US, and thus make it easily available. However, the price has had to remain high to cover initial costs. Unfortunately, we have had no luck at all in selling copies in the US. We believe this is because of the high price.

To show that we are not just in this for the money, and to show our commitment to producing new software for the Atari 8-bit community, we have decided to take vertually no royalties on Digi-Studio, and as such we have managed to lower the price down to just $15, including shipping.

This price will get you the 44 page manual and 2 SD/DS disks. You get all the usual programs included: tune player, keyboard player, sample editor, tune to Basic compiler, and the LIDS language compiler v1.2.

At this stage I need definate advance orders. If you are finally persuaded to buy Digi-Studio at the new low price, then please email me and say so. If I manage to get just 10 pledges for orders I will continue to sell Digi-Studio in the US. Send no money now. I will let you know when we are ready to sell at the new price.

Dean Garraghty. Email: djg0@aber.ac.uk.

Duane,

I'd like to encourage you in your effort. It would definitely increase
the value of our beloved computers if we had an ANSI-C compiler
available. Since a lot of 8-bit Ataris have extented memory nowadays,
128K as a minimum wouldn't be too much of a limit.

good luck!

Source record: 106960

As you may know, I am running a competition on issue 12 of my News-Disk. The closing date was 7th May. However, I had problems posting it to the archive, so some people may not have had a chance to enter. I am extending the competition deadline to 21 May. It's easy to enter. All you need are all 12 issues of the News-Disk which are in the Djg directory at the archive. You can email me your answers and details. Lots of very nice software available as prizes! Enter today!!

A question: I downloaded the HALLE93 files from the archive. How do you get these things to boot? I tried them on my 130XE with Happy 1050 and the things just gave a black screen with lots of squalking noises!

Dean Garraghty. Email: djg0@aber.ac.uk.

Yes, I started with the Assembler/Editor cart to do my programming (routines to be called from BASIC), but then moved on...

> Mac/65 also has other niceties besides macros: textual error messages
> (instead of numbers), more operators and directives, nicer automatic
> formatting in the line editor, etc. Minor enhancements, I suppose.
> The only big addition is the debugger; it's smart enough to
> automatically save and restore some interrupt vectors and shadow
> registers, plus lets you break out of a running program with a
> keystroke.

This is all true, but I would really focus on the macros and the directives and operators. They made doing tedious jobs easy (high bit set text strings, etc.). As for macros, for writing large programs, they are indespensible (IMHO). I wrote many LARGE games in Macro Assembly (though, not Mac/65) and macros made the difference of 2 or 4 floppy disks for the source.

> Come to think of it, I don't think I ever wrote a single Mac/65
> macro...

Not me, I wrote a whole structured set of macros to allow me to do things like:

```
%LOOP
..code..
..code..
%BNE
```

and

```
%IF NE
..code..
..code..
%ELSE
..code..
%END
```

all with complete nesting. Trust me, macros come in handy.

1463. DOS XL (was Re: Synchromesh)

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-11 17:11:57 UTC
From: jjmcwill@next5
Message-ID: <1993May11.171157.13646@mtu.edu>
Source record: 107022

DOS XL was a DOS put out by OSS way back when. I think OS/A+ was its predecessor, and that SpartaDOS was based much on DOS XL.
It had a command line like SpartaDOS or IBM's PC DOS does, but unlike SpartaDOS which uses a custom disk format to support subdirectories and time/date stamping, DOS XL worked with standard ATARIDOS formatted disks. All its utilities were located in .COM files instead of being part of the DUP.SYS menu line on Ataridos.

Chuck has been showing up on GEnie, as recently as last week, answering questions on this and other 8-bit matters. He strongly stated there that he did *not* have the C language package finished, and in cartridge form. It is still a cross-compiling language (using a PC) as I understand it.

That's not correct, as for a time both OSS's DOS XL and ICD's SpartaDOS
were on the market at the same time. As I just posted before I read your
message (you changed subjects on me!), when ICD took over the OSS product
line DOS XL was dropped in favor of SpartaDOS.

1470. Hey RICK! MULE WORKED! :)

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-11 22:31:19 UTC
From: anyone@cyberden.sf.ca.us
Message-ID: <wqPe4B2w165w@cyberden.sf.ca.us>
Source record: 107028

I used DOS 5.0, an IBM 486 clone with A: (3.5"), B: (5.25") and C: & D:
(HD) and even F:, Y: and Z: (network) drives!! along with an Atari 800,
stock 1050, and MyDOS 4.53/4.

Mule worked like a charm. Unfortunately I was stuck using one drive on
the Atari (one 1050 on the 800). I'd prefer to use a RAMdisk, but NOOO!
I forgot that my RF-TV port on my 1200xl with 256K doesn't WORK any more!
(the channel switch has been taken for the OS mode switch..)

Anyways... even though A: drive was the 3.5", I was told that using the
DOS command SUBST (substitute) could fix it, and it DID! I made drive B:
pretend to be drive A: (any calls to A: would be redirected to B:)

Pretty cool..

all I actually got transfered was a 32-byte file I copied from E:ditor as
a test ;) but it DID it!

all I need to do now is to make an IBm program in C or BASIC that
translates all ATASCII [RETURN]s to 13's (155=cent sign in IBM ASCII)

anyways ... pretty trippy!

Jeff,

Oh really? Soooo, what is Chuck up to? Anything worthy of note?

He dropped off the face of the earth quite a while ago.
For a little while back about a year or maybe 18 months ago he was
writing stuff for AtariUser in the 8 bit section, but then even that
stopped. About a year ago Ron Riche announced that he would finish
up Version 5 of Textpro real quick, and from the on Chuck was gonna
take over support for the program. That was almost a worst nightmare
come true. Chuck bought up the Transkey and went NOWHERE with it.
When Michael St. Pierre owned it, I got no less than three ROM revisions.
There are still some things that could be added/fixed, but Chuck just
ignored them and idly sat by reaping what profits there were to be had
from the sale of Transkey boards. I figured that Textpro 5 was doomed
to the same fate. Well, it doesn't really matter, Ron Riche still
hasn't officially finished Version 5, and who knows if he ever will (sigh).

Michael,

Thanks for clearing that up. I wrongly assumed, based on equivalent
COMTAB locations, and that Sparta was a command line DOS like DOS XL
and OS/A+, that ICD based, maybe copycatted is a better word, alot
of the "look and feel" of SpartaDOS upon OSS's work. Gee, had that been
Apple instead of OSS, ICD might have been sued long ago!
Okay, so maybe that joke wasn't THAT funny.

Jeff

If you're looking for an Atari 8-bit emulator, there isn't one. There are one or two programs that enable a PC to read Atari 8-bit disks. If you want an emulator for Atari ST programs, I've heard of one called the "Gemulator". You could find out more about that in comp.sys.atari.st. And you might be able to use Gemulator to run Transformer (an Atari 8-bit emulator that runs on the ST.)

These comments about Mac/65 are not true. It has always been able to
assemble from source code in memory directly to memory. Plus the source
is kept in a tokenized format (a la BASIC) so it requires less space.

Bill,

Have you ever heard of DDT? It's a debugger built into MAC/65.
Lets you do the same thing you just described with AtMAS II.

Jeff

1479. Disk format wars

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-12 15:09:46 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305121418.AA19506@smithkline.com>
Source record: 107034

Ummmm.... I've been outta touch the past couple weeks, having been preoccupied with getting the AC June Software Disk into production & also just finished editing the June issue of AC. My email here went totally berserk the past couple weeks, so many people started sending me stuff all of a sudden that my allocation choked & I was forced to dump several issues of the Digest in order to preserve space for critical magazine communications.

Now I'm again beginning to settle down into some semblance of normalcy, pop back into the Digest & find a roaring flame war going on involving Amiga/ST & MS-DOS drives, etc. Obviously I've missed something.

Was there some cataclysmic eryuption during my brief absence? I mean, is this still the 8-bit newsgroup? (The header & everything else looks the same.) I don't recognize the names of the people involved in this discourse, it is all very strange to me of a sudden. Or has the Internet address changed, & now this Newsgroup is devoted to the Twilight Zone instead of Atari 8-bits??? Someone, please tell me where the 8-bit Newsgroup is?

In the off chance that one of the many flame wars between the ST/Amiga community has spilled over into our Newsgroup, we should not allow ourselves to be drawn into it. These people need to be gently ushered out, back into their advocacy newsgroup or wherever they came from, without our taking a position on their arguments one way or another within this forum.

I think us 8-bitters have enough business of our own to conduct, let's stick to the topics to which this Newsgroup is committed. We are a small & Faith-ful Few, & one of the hallmarks of this group is its remarkable absence of the idiocy that seems so prevalent in other groups. The folks who enjoy these dogfights can always go to those other groups to fight their battles. But let's not have them here, it goes against the grain.

I'm still looking for the CSA8-IA8 I used to know: the one full of posts by dedicated 8-bitters, flavored with occasional weirdness & humor...

Hey... WHO DAT? Rod Serling! Wow, man, I didn't know yoo wuz an 8-bitter, too! Totally outta sight, man......

Bill,

> all I need to do now is to make an IBm program in C or BASIC that
> translates all ATASCII [RETURN]s to 13's (155=cent sign in IBM ASCII)

actually I'm using a small program on the IBM's called 'show'
which does exactly this.

It's a replacement for the MS-DOS 'type' command.
You just type 'show whatever.txt' and voila, your ATASCII text is
displayed on the screen.

I think if you type

show atascii.txt ascii.txt

you'll get a translated copy of your text.

If you or anybody is interested in this .EXE file for MS-DOS then
just drop me a line and I'll email an uuencoded version of it.

Marek

Source record: 107042

The speed advantage is because of the tokenizing, but that IMO, created a lot of stored programs that are in the tokenized format & as we just saw, Bill for instance wanted to look at some source & didn't have the cart or the utility to convert them to ATASCII. Personally, I save all my stuff in Listed format just in case someone wants to look at my code (rare <grin>). I also have a tend to write longer streaches of code with fewer compiles in between then most people, I hear you about how slow it is, but when I do compile it gives me a chance to get a coke & see what's on TV. Segmented files? OK, there's a utility to unify them, but still, I wish the MAC wouldn't create them in the first place. All that tokenizing/debuging code takes up almost all of page zero & the entire bottom half of page six. Jeesh! That's where I live! I've found I end up doing a lot of "ASM,,#D9:TEST.OBJ", exiting to DOS & trying the code because of this. It ends up like I'm using a disk based assembler. The other thing is cost. I paid $5 for my ASM/EDIT cart at San Jose Computer, the MAC was $72. Unless you do a lot of coding, let's say it cost you $10/hour to sit there waiting for your program to compile, you'd have to wait through 7 hours of longer compiles before the MAC makes sense.

DItto!

HOWEVER... be careful when planning your 130xe RAM access.. I HATE it
when programs like Quick redo your RAM disk. I have 256k so I have a
192k RAM disk, but Quick only recognizes 64k of it! Since I use MyDOS I
don't have any RAMDISK init'ers a COM files and always use the menu one.
(Actually, my DOS.SYS is set up for 192k and all I do on boot is init it
and copy DUP.SYS to it and whatever else I need at that sitting).
Anyways.. I WOULD set up my RAM disk, the copy the Quick files to it and
run off of there TOTALLY (NOT using Quick's use of MEM.SAV (I NEVER use
MEM.SAV!!!) or any other RAM disk set up it uses), BUT... Quick doesn't
work with MyDOS, which is a total downer for me :(...

Then again, neither does Draper Pascal.. :(

1483. ScotchDOS ... ok NOW I'm getting somewhere

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-12 22:26:10 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <B7Jg4B6w165w@cyberden.sf.ca.us>
Source record: 107040

Well, after talking with a few people ... esp. Glenn Saunders, who seems the MOST interested in this project (maybe even moreso that >I<!), I have decided a few things.

ScotchDOS is JUST going to be a CLI .. it's not going to act like SpartaDOS and do all of the SpartaDOS things... I've been suggested to implement some sort of "<" access like SpartaDOS does...

ie, you're file is in:

D1:COMPUTER:STUFF:GAMES

and you are in

D1:COMPUTER:JUNK

to access the file, you could either type the WHOLE path! or just

<JUNK>GAMES>file

Sure, that's great and all, but that's a DOS thing! NOT a DUP thing!

The DUP things which ScotchDOS will add to your system are:

batch file processing_
interpeter style commands (ie, math, strings, all sortsa goodies)
GOOD path access ... no [R] command for changing directories.. this will be a REAL Sparta / MS - DOS type command .. good ol' "CD"!!!!
File -> File parameter passing... VERY nifty stuff ..uses page 4 RAM (cassette buffer)

that's about it .. as general as you can get.

I DON'T think I'll try to implement MEM.SAV, as >I< never use it and I'm pretty much saying that "IT IS BEST TO RUN SCOTCHDOS WITH A RAMDISK OR HARD DRIVE!"

Once again: ScotchDOS will >>NOT<< be a MyDOS >>DOS.SYS<< change!!!

YOU WILL STILL BE USING MYDOS!!!!!

It's comparable to BobTerm's DOS commands... it's JUST A WAY oF GETTING THINGS DONE!

And it should be GOOD, too! ;)

thanx to all who've shown interest...

guess what tho! I've started OVER AgAIN!

I'm programming like I've been preaching lately...

USE COMMON CALLS!!!!!

Ren, Del, Lock, UnLock, etc.. all use the same Proc'edure in the program.. they just have different parameters.... (ie, Del FORCES you to answer "y"es/"n"/o, and calls XIO 33, while Ren DOESN'T ask questions and calls XIO 32)

Also, just as with plain old MyDOS, the internal command switches will be available... hell, even DIR will have some "oddities" (wide, dirs only, etc... actually, as I thought of this, I began wishing plain MyDOS (the DOS.SYS) had the ability to list, say, all the Locked files... like this maybe:

OPEN #channel , 6 , type , mask$

like OPEN #1,6,3,"D:*.*" would show all directories in the current place..

)

Another DOS.SYS thing I miss (which I'm not touching either!) is drive 0 ... IS there such a thing as Drive 0!?!?!?

ie, say I was in "D2:BOBTERM:VER122:PHNUMS:" and wanted to simply see "D2:*.*"... i could call "D0:*.*" (Robert Puff, ya listening!? ;))

or, say I didn't know WHERE I was (say it's some program in which the dis could be in any drive (d1, d2, d8, d9, whatever)), and wanted to see the root or access it... a D0: call would be VERY helpful.

Actually, I think BobTerm does this..

interesting that one of the current authors (supporters) of MyDOS is also the author of BobTerm...

;)

hehe

From: ak354@cleveland.Freenet.Edu
Message-ID: <1ss7ob$9nu@usenet.INS.CWRU.Edu>
Source record: 107041

I bought an Indus GT when they first came oout primarily because it was double density, but also because of the promised Synchromesh high speed data transfer. Synchromesh was supposed to be sent as a free upgrade, but I ended up having to pay $10 to get it. It works great, but only with DOS XL. Synchromesh II supports the optional 64K RAM buffer in the Indus. It's weird to be retrieving files from the disk when the drive is not even spinning! With the 64K RAM card installed, you can also run CP/M using the Z80 in the drive. Pretty neat, but it would have been a lot more useful if they had released it earlier.

I was surprised to find that no one had hacked the GTSYNC file so it would work with SpartaDos. I used SpartaDos regularly and felt deprived that I couldn't take advantage of the Indus high speed mode. Kyle Dain worked on doing this at one time, but we never completed it. The GTSYNC file actually transfers Z80 code into 2K RAM in the drive to set it up for high speed data transfer. There was something at the end of that process that SpartaDos didn't like. If there's anyone out there who like to take a shot at this, please let me know!

1485. WANTED: BolderDash and Other stuff...

Newsgroup: comp.sys.atari.8bit

From: mat@unh.edu
Message-ID: <MAT.93May13035715@metro.unh.edu>
Source record: 106916

I would like to get both BoulderDash and The BoulderDash with
the Level Editor for my 800.

Also, with my system I got MAC/65 but I have no docs. I'm not
sure but I think I remember something about it not working on
an 800 with only 32k. Anybody know?

Which brings me to my next question, I would like to get some
additional ram or info on how to hack some in. ???

Other than adding ram, would anyone have a 1200xl (I'm assuming
this one had or was able to have more ram PLUS a built in disk
drive??) for sale?

Thanks, Mike

The DDT in Mac/65 is a scaled down version of the original Dunion's Debugging Tool sold through the APX. Having never used the original, the most obvious difference is that the Mac/65 version uses a much smaller screen. I think there were also fewer breakpoints. Are there any original DDT users out there with more info?

Well, by the title, Im guessing you want an Atari emulator for an IBM ;)

The only thing like this I've heard of is the XEC130 which Atari didn't allow (it was a 3rd party project from not too long ago).

Heck with 640 x 400 and 4 of these (they were cards) you could run 4 programs seperately. I wonder if any sharing was ever thought of ... ie, point, click some text, press something (maybe a menu bar with the extra 16 scanlines out of the 400 up at the top) and then pointing to another "computer"'s screen and pasting to it! (some sort of Ghost-Typer forced data entry thing or something! hehe)

interesting idea.... unfortunately, as I said, Atari didn't allow it because you'd HAVE to use Atari chips (CPU, POKEY, ANTIC, etc.)

Hey, to each his own! I really would like to know what the Assembler/
Editor cartridge is doing, though. It's small and reliable, but--great
grains!--the abysmal speed is something else. Is Lord Quest still around?
Maybe he's got some insight.

As for page zero and six usage, that's a definite drawback of Mac/65.
I always used "normal" memory for development and then switched to page
zero (a single line change) for the final assembly. Worked pretty well
and it didn't matter when writing USR routines for BASIC since you
had to assemble to disk anyway.

Did anyone ever use the more exotic assemblers such as SynAssem
from Synapse? I assume that's what all the Synapse games and apps
were written in.

The Deep Blue C author is definitely alive and reachable via
email. Whether or not he has the source or remembers anything
about it is unknown (to me at least), as he doesn't seem to
be involved in the Atari world any more (a Mac enthisiast, I
believe). Maybe I'll try to give him a gentle prod toward
this newsgroup, but I don't want to hassle the poor guy about
ancient history. (Or heck, maybe he's just lurking.)

BTW, it is likely that Deep Blue C is based on James Hendrix's
Small C, the source to which was published in a book with "Small C"
in the title by the same author.

James,

I have the Extended DDT, which is pretty nice. It's sort of a symbolic debugger. On one side of the screen is a place to constantly watch a set of arbitrary memory locations, which can also have names assigned to them. THis way you can watch variables change as you step through code and stuff. Unfortunately, it's a bit of a memory pig so I usually stick to Omnimon XL built into the OSNXL chip.

damn marek.. you said "these arent that mindboggling" or something

HELL THEY ARENT! :)

I've so far got most of C (damned file is only 54k at the place I transfered it to.. instead of the correct 86k!) and all of part B (altho it dies at the end, and when I hit [Reset] it starts over)

Anyways... part B ispretty awesome! Cant wait to impress the VGA-owning IBM freaks at my school ;) .... the first demo on part B ... crystal hammer.. damn, that's rude! Is that 100% digi? 100% synth? 1/2 & 1/2? How'd they do it? Is it a digiplayer much like Torsten Karwoth's?? Btw- what's Torsten's handle, if any...? (I'm wondering if he's on the graphics greetinx. ... havent looked at it all tho, but most names are by handle..)

Anyways... as for the vector demo.. sure, seen one in one of the HobbyTronic demos, but this one is rude because it displays the image on TOP of another image... i noticed something about "slow but good" (cant see much of the scroll line on my TV :( ) ..anyways. ... are these Vector demos (Halle and HTronic) done by screen unpacking? I recall a High Tech Team demo with that on it... "HTT GIGA UNPACKER - slow but good" ... it was on the Expo 91 disk methinx..

anyways... wish I knew german ;)

wish I had PAL tho, too .. does this Graphics screen (3rd demo, disk B) actually DO anything other than display 256colors?

hmmm...

thanx

thanx for uploading 'em Marek (it WAS you, wasn't it?)

It does in fact work great! The SDX loads the Indus.sys into the Indus itself,
taking up no memory in the Atari. The speed is equal to that of the US doubler.

Too bad my SDX died today...I just got an Indus and was really happy withit...
Ah well, there's got to be a few SDX carts left somewhere...

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

-> If your Amiga OS allows you to read all disk formats, then good. Ours
-> doesn't simply because we never needed it, and so no one ever wrote
-> anything to do so.

YARK!! Atari world is so closed that nobody needs to exchange with
other platforms ??

Today, it's impossible to live in such closed world ...

... if you just play games, ok, no problem !!!

But, if you want to print on a laser printer service running on a PC, or
you need to include an EPSF drawing from your friend that have a Mac, in
your word processor ... if you can't , big troubles !!!

And, such things are very very frequent !!!

Just a simple example :

When i am doing FTP, i ALWAYS copy files directly form the Sun's floppy to
a MS-DOS Disk, and i read them directly with my Amiga ...

I think that all people that needs to do many normal things with their computer
AVOID to buy a ATARI ST/STE/TT/FALCONVAPORHARDWARE 'cause they know that
computers can't ...

... other that buy ATARI don't care what others do, they don't know frequently
what AMIGA/MAC/PC do !!!

-> How many Amiga users run their WP in full 4096 color mode ? OK, maybe
-> they will use it for games, but that's about it. And if you don't want
-> to play games, you bought an expensive piece of hardware for no reason
-> whatsoever.

Very ridiculous !!! ;-)

The coprocessors of Amiga aren't so expensive ...

... and, see what xVGA do, and look prices. Look also WHO HAVE a VGA on PC.
Almost anybody ...

i didn't think that Amigas will be less expensive if you eliminate the
4096 modes ! ;-)

That's a very good idea to C= for have place such possibilities in ALL
AMIGAs. The software makers didn't ask them "will i use these modes" ?
THEY USE-IT !!!

And, in opposition to ATARI computers, all these colors on AMIGA have
professionnal applications and using. I think you know well DESKTOP VIDEO
and MULTIMEDIA.

-> But on the ST, if you wanted it from the start, you would have bought
-> the required hardware along with the machine. And what you don't need,
-> you don't pay for.

HEY! ;-) 4096, and now 16 million of colors ar NORMAL configurations today!!!

Perhaps not on ATARI, but on ALL other platforms you need only some peanuts
to get thems ... ;-)

I did not think that computers will be very less expensive without it.
The difference isn't so big to not get these colors ...

... and on ATARI, if you get these card ... how many softs support them??

-> I've had my ST for 6 years now, and I still like it a lot.

I have an Amiga since 1986, and i have choose it considering also ATARI.
But it was definitely CLEAR to me that ATARI ST offers ALWAYS less than
Amiga computers, on Hardware AND on OS.

When you try an Amiga ... you didn't want to exchange it with a PC, a MAC
or a ST! ;-)

You get many things unavailable on others computers, and you won't loose them.

-> If the computer had indeed been well made, you wouldn't have to change
-> it every year.

Very stupid! ;-) NO COMPUTER IS PERFECT (don't try to say me that your ATARI
is perfect ... i can go with an AVALANCHE of cheap things on it), and all
users have many advantages to upgrade their systems !!!

Seriously, that's very very alarming for ATARI users to see that ATARi isn't
able to release his computers ... it's for when the FALCON ??

And, nobody change is Amiga at every year ....

... i have change mine this year, form an A500 that i've owned since 3 years, toan A1200
that i will surely keep 2-3 years.

All new features, as AGA graphics processors on A1200 and A4000 are very
attractive to many users, and it's normal for them to want buying one! ;-)

-> Buying a TT or Falcon is another matter.

TT have technologies of yesterday ... not interesting at all !!

(YARK !!! What a PIZZA BOX !!!!!)

Falcon, can you buy one PRESENTLY ???

Falcon is technology of tomorrow for after-tomorrow ... with promises to
be relaesed yesterday!!!

The important thing is to be satisfied with youe computer, same as you said!

But, try seriously an Amiga 1200, and i sincerely think that you will never
want your ATARI again.

>As for page zero and six usage, that's a definite drawback of Mac/65.
>I always used "normal" memory for development and then switched to page
>zero (a single line change) for the final assembly. Worked pretty well

I wish less programs would use page zero. I have this 1050 turbo module
from Germany (gives me high speed and 180k) and it puts some code in
page zero or six (can be choosen at boot up).
It very frustrating to see how that that code gets overwritten by another
program. I then can still read up to 180k but the drive works even slower
than a normal 1050.

By the way, are there more people that have this 1050 turbo module, and what
are their experiences with it ?

crystal hammer is digi sound. This part comes from W.A.F which means
'Wuerzburger Atari Front'. It's one of the regional groups of ABBUC.
On the fair I asked those W.A.F guys how they did it. They didn't
wanted going into details. All they told me was that the graphics were
done entirely of player shapes. I don't know the English expression
for this. All I mean is that you turn off all DMA, turn off the
screen, turn off everything; everything you want to display you
poke into this particular location where it changes the shape
of players. Don't remember the address...

Isn't Torsten's nickname the "ARC Angel" ?

Oh, I think the problem is your Happy. On our last ARGS (ABBUC) - meeting
somebody have had some problems with his Happy too.
I'm not familiar with Happies, but can't you switch off the upgrade
to act as an ordinary 1050?

BTW: The demo will lock up when you reboot the disk by pressing RESET.
Actually you have to turn the computer off and then on in order
to boot the way it is supposed to boot.

> By the way, are there more people that have this 1050 turbo module, and what
> are their experiences with it ?

Jos,

I've got one since 1988 (?). My experiences are very similar to yours.
It's especially annoying to me that high speed doesn't work with
Turbo Basic XL once you've pressed RESET. I know there's a hack for
this, but I can't find it anymore.

Which version of the backup program do you have? I think my version
is III and it still can't handle other formats than single(!) density.

BTW: The backup program failed to produce a working copy of the
game 'Cities of Gold' from EA. There's a track on disk that has
to be corrupted. The game checks for this bad track and wouldn't
run without it. I've tried to make a bad track by hand using
inverse characters within the 'Magic Formatter' and it's not
the same kind of bad track that EA uses.
That way I have to play with my original disk, without any backups.

Do you happen to know other ways to produce bad sectors/tracks
with the 'Magic Formatter' than inverse upper case and lower case
characters?

Did you ever try to disassemble the EPROM in the turbo module
in order to improve the software?

Mike

From what I understand, you may still be able to get ICD to fix your SD-X cartridge. It's my understanding that although they no longer sell their 8 bit products, they still provide support similar to what you need. If that proves unsuccessful, somebody with an EPROM burner and a good cartridge might be able to burn you a new set of ROMS for the cartridge. That is the only thing that could go bad, except the gate chips...

1513. DOS-XL vs. OS/A+

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-14 21:56:30 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305142131.AA10878@smithkline.com>
Source record: 106972

At the risk of inserting foot in mouth I'll offer the opinion that OS/A+ & DOS-XL aren't the same. I have them them both, but never used them much. (I have trouble getting excited about all these DOS's we have for the 8bit, I long ago settled on using one or 2 & simplified my life.)

It seems to me OS/A+ was promoted heavily by Percom, it may even have been sold as part of the drive package at one time. Anybody...?

Whereas DOS-XL was promoted by Indus as part of their drive package, along with Synchromesh & a few crummy software programs- some kind of database & I think a primitive wordprocessor or such. Anybody...?

Both products were from Bill Wilkinson's OSS. When ICD took over OSS, they continued to produce DOS-XL but not OS/A+. Probably because by that time Percom was totally dead but Indus drives were still selling (Indus died out around 1987).

At least one program from XLent- their database I think- required DOS-XL or had that DOS built into it. I didn't like it. It wasted a lot of time at bootup telling me my 1050 drives weren't Indus (big surprise). After much fiddling, I somehow got it to run under Sparta 2.3e, but DOS-XL was still there too, like DOS-XL was running under Sparta (????). It was very cumbersome. I gave up on the XLent database, needless to say, & sold it at at a fest. The whole thing was very weird, an exercise in frustration.

I just spoke to the good folks it ICD, they can and will in fact fix the cart. I spoke to them for about half and hour, and they indicated that the repair side of the 8bit biz was doing good. When I pointed out to them that were in fact two companies getting ready to produce RT8 clones they started talking pos about the 8bit. When I tried to press the issue, they said that while there is some interest, there is just not enough there to make them think about reproducing 8bit products.

Mike

BTW their product line is still for sale...production seems to be a requirment of the sale though...

I believe you can get the source by buying a floppy called
"Deep Blue Secrets", which sells for $15 or so at B&C
ComputerVisions (408-986-9960). I'm pretty sure I saw this
floppy last weekend and the notes on the back indicated that it
contained the sources for Deep Blue C. Of course, you should
verify that before you buy it.

Hmmm .... did I miss something? or are you justing going crazy
yourself?

So... who here has looked at that Halle93 demo?

I WANT A MOD PLAYEr!!!! NOOOWW!

I've actually been asked by a few IBM'ers if I'd like C-source to a MOD
player (or was it something else?) and definitely the format of MOD
files... I said "YES!" ... sure, I'm not exactly ... well.. ANY sort of
C programmer, but perhaps if I do get C source, I'll post it around if
ANY of you C hackers are interested..

I'd like to see one. I've already heard a while ago that there were two
out. and the crystal hammer demo on the Halle93b disk says SOMETHING
about that there's not an actual MOD player out (or something like
that... I dont know German).. maybe more to the fact that "the code used
to produce this demo isn't out in a general MOD player program ...YET".

maybe I'm dreaming

anyways... anOTHER demo ... the one with the cool "disco" lights (as some
have described it) and that flickers on NTSC screens ... explains that 1)
the title was made with WinWord on a PC (hehahhahah slaving IBMs to the
8bits once AGAIN!) and that the music was xlated from MOD to Benjy
SoundMonitor.

Damn... where does one GET all this COOL stuff!?!?! I have ABSOLUTELY NO
GOOOOOD sound program. I have the BASIC program Sound-Master (I think?),
as well as some French demo/composer and some other things.. including
some LAME BASIC composers (they are PATHETIC) (but I made them years ago,
so it's an excuse) that I wrote. :)

Anyways... so Ben? You seen any of this cool stuff???? :)

Have I heard of Mac/65!?!? NO!!!!

No, just kidding. Jeff... I hate to tell you this... but....well...

I'm not an assembly programmer..

and DAMN I wish I were!!! :)

<growl>

I'd like to get my hands on:
that ANSI C cart
Mac/65 cart or AtMAS II disk
Action! cart ... oh wait I already have it
and a TUrboBASIC XL cart ... oh wait, there is no such a thing
anyone wanna burn me an EPROM? ;)

This is true, the Indus shipped with Dos-XL and GTSYNC.com (Synchromech) but
included three additional programs; 1) GT Estate Wordprocessor and GT Speller,
2) GT Albert E. Spreadsheet and 3) GT Data Manager. While minimal at best,
provide a new user with something to start with.

I forgot all about that! "Deep Blue Secrets" was another APX product
and it did indeed contain the source for Deep Blue C. Kind of
interesting that you could purchase the source for a commercial product.
(APX also sold the source for Chris Crawford's "Eastern Front," BTW.)

Well, I got A all I need is C :) ... I LOVE the music at the beginning of A. Unfortunately it seems at least two parts (at the end) of A don't load... and 1 at the end of B doesnt. I've seen the beginning of part C... pretty trippy soundwaves! :)

I think I figured out the 2nd part of part A, too... the one with the BIG LONG scroller and the HALLEPROJECT logo with the tiles swinging back and forth... at first I thought "WOW! Cool blitter-style animation", thinking it was block-moving the graphics around.. then I noticed it isn't SMOOOOTH smooth and figured: IRG FONTS! or font and then multiple screens.

Also, the one with the WINWORD'd title and MOD->Benjy Soundmonitor music and the "disco lights" was pretty neat... I made my own disco lights in TurboBASIC XL ;) ... fun stuff..

If I knew assembly or Quick or even Action! quite a bit better, I could probably hack away some nifty demos myself! ;)

and I'll try the keys with that 256-color "do nothing" demo...

thanx!

is there a scroller on that screen? there's TONS of room for one, but I dont see it!

oh yeah, who here doesn't understand how they did that 256-color square..? I do! And no, it isn't just graphics 9 and a multiple-DLI ... look closely... or try it yourself. After I looked I was a little more impressed with it ;)

It came up last week on the GEnie RT, CSS is said to be close as well to putting out an R-Time 8 clone. I've not talked to Bob about it, and its not in the new catalog I just got, but it was somthing the people at ICD seemed to know about already. Talked to the folks at Best, the programing job has been sent to Poland, seems the programer in England got better paying job. They're hoping to have their R-Time 8 clone out soon, and hope to sell it for about $40 +-. It could come in one of two forms, a cart type or an under the hood type, it sounded as if they were still a little iffie on that one. We'll have to drop Chris Free???? (I cant remember the name) a note, I know he's here on the Internet, and ask him about the CSS RT8 clone.

Take care.

Well, that's all just probably using some SIN/COS function (a table, for speed, I suppose). I'm not at ALL good with 3d rotating, but 2d, EASY PEASY! :)

I have yet to make a good screen rotater though. A vector spinner, sure, but to rotate the screen and not get holes all over it ;) ... not uet

then again, been quite a while since I tried..

I DID make a program that "flushed" graphics nine screens... it sorta rotated.. the picture would end up sorta like a frame from the beginning of Liquid Television ;)
ehhehehe

i should post the source (TBXL sorry eheh)

From: Chris_F_Chiesa@cup.portal.com
Message-ID: <81445@cup.portal.com>
Source record: 106990

The remarks about ATMAS II having advantages over MAC/65 in that it has a built-in monitor, and that it avoids the need to "load in" MAC/65, lead me to wonder if perhaps the writer of that (Scroll?)text was using the original DISK-based version of MAC/65, rather than the cartridge. That's the way _I_ first encountered MAC/65. And the debugger was another, separately-loaded, command-line-driven, thing called BUG/65, not the DDT that supplanted it in the cartridge...

Personally, I preferred BUG/65 over DDT, 'cause I had more control over it: you could tell it where to load into memory, save versions of it that loaded into any arbitrary address you wanted rather than relocating like the original, etc. etc. etc... I still have it, but now can't find the manual...

Mike,

I think that is Chris Freemesser. Hope I got the spelling right.
An under the hood RTIME 8 would be great, I really tire of having
BASIC XL, on top of Sparta-X, on top of RTIME8. Actually, I got a
DS1216 smartsocket, which could theoretically reside between the
motherboard and the OS ROM, and you could read the time date from that.
I've never been able to get any code working with it though.

Jeff

: The spacebar on the keyboard of my old Atari 800 is gone. I opened it up to see that
: the metal pin had broken off. Is there any way I can get a replacement keyboard for it?

: Also - my 1050 drive has a bad habit of overheating, and when it does it shuts down
: refuses to read/write. Can I do anything about this?

: ---
: Ralph Hoflich

I am no real sure about the keyboard (although I know they used to be sold)
but the job I do here at school often required me to fix IBM space bars that
went bad. With a little music wire and some way to bend it, you can easily
make your own repair (if that is the only key broken).

Concerning the 1050, I have a similar problem with my 130XE. Exact same
symptoms and everything. I don't know what causes it, but I took an old
IBM power supply fan and wired it across the power switch of my XE.
Although the fan is 12V and the Atari runs on 5V, the fan makes enough
air flow to keep it cool (as far as I can tell).

Hope it helps,
Lance "Ate_bit" Murdock

1544. 850 Interface

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-16 14:55:46 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993May16.145546.99909@austin.onu.edu>
Source record: 107000

Here's the deal. I just bought an 850 interface, and after reading through the entire vague and unclear manual, I still have no clue what is wrong. The manual is the original version of the manual, and the only thing they discuss hooking up to the interface is the 825 Printer and 830 Modem.
Question 1.) Are there any updates/revisions to the manual that are a little more clear (I assume there has to be)?
Question 2.) Could somebody tell me how they have their interface configured?

As far as I can tell, it appears that the port must be configured using a BASIC program everytime you want to use the thing. Also the ROM based driver has many bugs, so I downloaded ATARISRS.232 from the archive and it works fine. But now I can't have BobTerm or any other programs AUTORUN. Right now I have to load ATARISRS.232 from DOS, then go to BASIC, run my Configuration program, go back to DOS, then load my Communications Software. And it still doesn't work! Sound screwy or what? I didn't think it would be this hard. By the way, if you haven't seen this manual I have, trust me you don't want to. I am a junior Electrical Engineering student, and I have a very hard time understanding what they are trying to get across. Any help would be greatly appreciated. Thanks in advance.

>
>Yes ICD will still fix their products but they charge $50 per
>hour to do it...I was going to send my r-time-8 in (4 the 5th

Hmmmm... Interesting, they're not charging me anywhere near that amount, what I got was a flat fee to fix/re-burn/re-place and ship. Now, I do know that there is a minimum charge to inspect and repair and MIO, but that charge is applied to the cost of repair... one of the members had his one meg'er fixed by ICD not all that long ago. If I remember right, there was like a $5.00 parts fee that was also charged. Still, I support anyone who supports the 8bit, and ICD supports the 8bit through the repair of their products. I will admit that I believe ICD found it could make far more money doing repairs than it could make selling product, but that's just buisness.

Anyway, the folks at BEST hope to have their R-Time 8 clone out in the near future...They've been getting many calls about it...the're far more 8bit Sysops out there then I think anyone dreamed. As I understand, the code for the clone is now being written in Poland, the current version loses time; something on the order of 12min per hour...thought I understand it does very abit. Once the new code is in place you should start seeing it hit the market for something like (I asked for a thumbnail price and was told) $39.95.

This is more to everyone who reads the net, I talked with ICD about getting their products out once again. The Atari folks say that the PACKAGE has been shopped for the last several years. It was indicated that they do not want to break up the PACKAGE. Several times during the a number of conversations with several people at ICD, it was also indicated that Production would be part of the PACKAGE deal. When you look at the costs of buying the rights and doing a production run, you can easly see why no one has been able to aquire the product line.

If nothing else, I hope ICD sees that there is some consumer base out here. and maybe once again can be talked into producing Action! and Mac65. For all I care, they can put the docs on disk and I'll print 'em out, that would save 'em a bit of up front costs. And to tell the truth, I wouldn't even mind if it cane on nothing but a bare board (much like the BB). I said the same thing to the folk at Best...

Ya'll take care

1547. AutoDesk Animator

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-17 06:02:12 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <DyJo4B1w165w@cyberden.sf.ca.us>
Source record: 106908

Guess what!? I'm working on a horrid little "AutoDesk Animator" - ish
animation program. At the moment, I'm working on a "prototype" version
which uses only Graphics 7 (unenhanced) and maybe one day it'll use some
APACish Graphics 7 or 15 or ColorView 15 mode.

Anyways... it's being made in modules.. AutoDesk's "Animator" is set up
something like this:

Menu Bar (I'm not doing it quite like this)

screen
`
`
`

`
`

Panel Commands Colors Draw Modes
Undo Commands Frame Draw Modes

The Panel is just the name of the current "control panel", the "colors"
is a set of colors to choose from (you have the VGA 256 color pallete if
you right-click it), the "Draw Modes" are things like "Opaque" (normal),
"Soften" (smoothes/blurs), "Jumble" (randomly jumbles dots around
cursor), "Glass" (blend colors), etc.. as you might tell from commands
like "Soften" and "Glass", one the Atari it'd be best to use a ColrView
mode ...

Anyways... "Commands" include, "Draw", "Line", "Spray", "Poly", etc..
you can choose options for these commands, and trade them for other
commands (ie, trade poly for text or draw for cirlce).. I thought to
myself "hey, why not just had a directory full of files which could be
chosen from a menu?" ... eventually, the main program got so big that I
decided to make each of my "modules" have more than one command, rather
than say, this line being one of the only changed one between each (BIG)
module file:

ie "100 IF FIR THEN COLOR CO:PLOT X,Y" on the "Draw" module and then
"100 IF FIR THEN COLOR CO:PAINT X,Y" ... very pointless! It'd almost
be good enough to "ENTER" the modules into one main program, but since
I'm using TurboBASIC (sorry!!!) ENTER is TOO SLOW....
but who knows... this program will require a FAST DrIVE (Ram/hard)
so it might be a more efficient way to do it...

So what on earth do these large modules contain?
well, they contain the routines to insert, delete, goto, and play frames,

as well as undo, load pics and animations and save them....

the code gets a bit ugly, and once you've made a few frames, you've got a bit of space/files on your drive, but it's worth it in the end.

The program uses a set of files named "FRAME.x", which are simply graphics 7 screens... when you delete, say, the last one (say you have 10), it merely calls "DELETE "D:FRAME.10"" and reduces the number of frames by one.

If you were to Delete frame 5, it would "DELETE "D:FRAME.5"", and then start renaming all of the frames after it with a number one lower... so again, you have frames 1, 2, 3, 4, and 5, and whatever was after them all numbered correctly. (I could actually implement this in the Network message base I made at my school, but it uses correctly numbered threading values (ie, a reply to message #10 will ALWAYS be to #10 ... even if #9 got deleted... rather than from now on calling #10 one less: #9, and going and changing the thread values of ALL the messages that used to reply to #10 to a 9, I just rewrite the deleted file with "DELETED", and when the message reader goes thru it just says "<message such&such deleted>"..)

Wlel, Im REALLY babbling..

then again, look at the time :)

so who's interested? who thinks this is a god way of going about it?

I mean .. I've got a 256k computer (192K ramdisk), and at a little over 3k per frame, >I< think I have enough room (at the moment)

oh yeah, anyone got a good FAST compression/decompression routine? (source??) .... I'm thinking of just using Clay Halliwell's CVSquash code .. knowing me tho, I'll change it to turbobasic ;)

1548. broken 1050

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-17 08:59:20 UTC
From: RG9@VAXA.YORK.AC.UK
Message-ID: <9305170900.AA22659@deepthought.cs.utexas.edu>
Source record: 106905

Well I seem to be having a bit of bad luck lately, one of my 1050's has died and I was wondering does anybody have any idea how to fix it.
The symptons: On powering up everything seems normal, however I then insert a disk and close the latch and nothing happens - no busy light - no spinning disk etc etc - just deathly silence.
I first noticed it a few months ago when I turned my printer on while the drive was busy, next time I tried it the drive had died, however after rebooting everything seemed fine, but unfortunately yesterday the drive did die. No amount of rebooting would effect a cure. I am wondering was the situation with the printer an effect or the cause or just pure coincidence?
To make matters worse I was in the middle of writing up a report with a tight deadline, good job my faithful XF 551 keeps on going!
Any help/advice would be much appreciated!

Thanks
Richard

1554. Problems with 600XL keyboard

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-17 19:56:26 UTC
From: dbstrutt@acs.ucalgary.ca
Message-ID: <93May17.195626.24924@acs.ucalgary.ca>
Source record: 106816

I just bought a 600XL yesterday for $10 and the thing works fine
except for the keyboard. Some of the keys don't work at all and
there is a definite pattern to which ones work and which
ones don't, i.e. the keys 3,E,D,C don't work, and they all fall
on a line on the keyboard. Pulling the keyboard apart revealed
that the keys that don't work are all connected by one of four
strips of that white material on one of the plastic strips that
lie beneath the keys. I looked everything over and couldn't see
any cracks or breaks in the lines, and cleaning everything off
didn't seem to help. Can anyone advise me here on what I could do?

From: rmccall@don.mcs.dundee.ac.uk
Message-ID: <1t8thm$k6j@dux.dundee.ac.uk>
Source record: 106914

I have owned an 800XL for about 3/4 years now. However I do need (would like) to be able to expand my XL to be able to use hard diks and 3.5 inch disks. Also I would likt to know where I can obtain an 80col wordprocessor that is actually some good.

CAn anyone offer me any advice.

Cheers

Rod McCall

1556. CGS MYDOS

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-18 05:50:23 UTC
From: G44@delphi.com
Message-ID: <01GYAXOGQM0Y8Y7E38@delphi.com>
Source record: 106915

The reason I used 091 was that TOM HUNT told me that 091 was the only one that works with MYDOS, despite the 093 dox
including the MYDOS and 2.5 info.

The Developer's dox also have errors in them.
They mention the cursor position command which was never implemented.
And the CGS toggle which I think is active in 093 only.

Tom is again working on the MYDOS problem, he thought he had it solved when he wrote 091 but such is not the case it
seems.

But I wanted to open up the discussion in case someone did manage to configure a MYDOS CGS 091 to get it working.

Anyone interested in this further can call my BBS at 617-444-4310 and leave feedback.

I would be thrilled to have a MYDOS CGS beta tester. I have a demo and no real way to test it.

At least I can't get it to work with my hardware i.e. 1200XLs, one stock,
one with MUX OS...

1558. TurboBasic EPROM

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-18 05:55:36 UTC
From: G44@delphi.com
Message-ID: <01GYAXV00H9Q8Y7E38@delphi.com>
Source record: 106918

Having a TURBOBASIC cartridge would indeed be an excellent thing to have.

I believe the reason it won't easily translate to an EPROM is because it fools around with the RAM under the OS.
This by itself saves RAM the way a ROM language saves ram though ROM instead of RAM addressing.

However, it COULD be made ala Sparta X and "use banked" thus not only
freeing up the under the OS ram for Sparta, but some more memory too with
EXTEND.BAS and such.

Or what about TurboBasic XE??

I mean, Basic XE managed to use all 128K back in 1985, you'd think the most popular Basic system of today (TBXL) would
have developed a similar extension...

Whatever happened to Frank Ostrowski anyway?

Rod,

A couple things to consider.

If you want to go to 3.5" 720K floppy drives, there are two good ways to
go about it.

1) Purchase an XF551 Atari drive, which is 5.25", and then upgrade
it via a Computer Software Services upgrade to 720K.

2) Purchase a Computer Software Services Black BOX and
the additional floppy controller card for the Black Box.

Option 2 has the several advantages. It can read and write IBM formatted
floppy disks. (The XF551 mod. can only read IBM floppies)
Speed will be a lot faster on the Black Box because it's connected to
the Parallel BUS instead of the SIO Port. You can also use 1.4 meg
3.5" drives, and 360K and 1.2meg 5.25" floppy drives with the Black
Box Floppy controller. Additionally, the Black Box has a SCSI/SASI
port for connecting Hard drives. There are a lot of other goodies that
the Black Box has to offer as well. A Black Box is really the way to
go to make your 8 bit a heavy duty workhorse.

C.S.S.
PO Box 17660
Rochester, NY 14617
716-429-5639

I am in no way affiliated with Computer Software Services or any
of their products.

1560. Textpro Xep 80 (not!)

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-18 07:54:18 UTC
From: d1dol@dtek.chalmers.se
Message-ID: <d1dol.737711658@dtek.chalmers.se>
Source record: 106919

I am using the Xep 80 soley as a printer port and was quite suprised
when Textpro (4.0x, 5.0x) refused to load when the xep-routine was loaded.
I printed out the manual for Tp 1.2! and it mentioned something about
not enough memory to have rs232 handler resident unless using
Sparta Dos 2.3c or so.
Well the rs232 handler was about 127 bytes only, while the
xep-80 is rather big.

so has anyone stripped down the xep-handler to be a printer interface only?
the Source to the Xep-STOCK-handler locked a BIT complicated.
Well, I'm not totally into 6502 assembler, however I have knowledge
in MC 6809 assembler, so I guess I could try myself, but I
dont have any book covering Atari hardware adresses and stuff
(like Mappin the Atari)
so If anyone can get hold of this book along with a doubler chip and
Sparta dos X, I'd be highly greatful and pay properly.

Is it possible to expand the memory on a 130 XE?
how does one do that, atleast my chips are soldered direct to the
motherboard, makin it difficult to un sold.

Have a nice day,

Bill Kendrick Novato, California, USA NEW BREED SOFTWARE!

The 'PackBits' compression algorithm (used in the TIFF file format) is
simple and fast. The first byte (I may get this reversed) if between
1 and 127 is the number of data bytes following; if between -1 and
-128 (ie 255 and 128) is the negative of the number of times the
following byte should be replicated. (Caution, as I say, I may have
gotton the two cases reversed). In TIFF a string like this is not
allowed to wrap from one scan line to the next, for simplicity in the
reader.

Your mileage will vary, because as you can see the amount of compression
will vary greatly with the content, although 30 and 40% reduction is
common.

Another scheme is your standard LZH algorithm, but it's not
recommended for small memory machines because the table sizes are
large. I have used 4K table size on the Atari (ie a 12-bit symbol)
with good results, but all I ever implemented was a decompressor.
A compressor can work, but there'd be no space left for your main
program unless you are creative with your extended memory.

I had a brainstorm for a graphics compression scheme. The scheme
would be for the reader to assume a scan line is identical to the
previous one, then the changes to the line follow. Might work.

If you're heavy duty into it I suggest looking into JPEG, which is
claimed to be very good; I have no idea what they do, or the amount of
table space or computation necessary. MPEG might actually be more
interesting in your application, because it is optimized for motion;
it can actually optimize for redundancy between frames. A tech.
bookstore may have the information, or you might get a pointer from

the comp.graphics FAQ.

1565. Re: 850 Interface

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-18 14:17:40 UTC
From: winston@merk.com
Message-ID: <C787pH.2wt@merk.com>
Source record: 106949

Why do you need to over-ride your ATARI 850 INTERFACE ROM code? What is wrong with it? I am curious....

Here is what I do for my ATARI 850 INTERFACE....

o When using DOS 2.5, I named the machine code boostrap loader as my AUTORUN.SYS file. This boostrap loader takes up only one or two disk sectors. Any terminal program that I wish to automatically load, I just append after the bootstrap loader using the DOS "/A" APPEND option. When I "boot" the system from a coldstart, before the drive spins up, there will be a one or two second pause followed by what sounds like a long "bell" or long "beep" tone. This is the 850 INTERFACE driver loading in from ROM.

o When using MYDOS and BOBTERM, I don't have to worry because Bob Puff has already built an ATARI 850 INTERFACE loader into the BOBTERM program code. While loading BOBTERM, if the 850 INTERFACE code is not present, BOBTERM will load it and you will here the long "bell" or "beep" tone. If while BOBTERM is loading it sees that the "R:" handler is already present, it will not bother to load the "R:" handler. When BOBTERM exits, I am told that it will unlink the "R:" handler. This makes it very powerful, as you can do such things as use BOBTERM and TEXTPRO in combination, exiting to DOS from BOBTERM, loading TEXTPRO, composing letters, saving them to disk files, exiting to DOS, loading BOBTERM back in again, uploading your letters, all without ever having to perform a cold boot. BOBTERM can be loaded back over itself again and again without worrying about "R:" handler conflicts, unlike KERMIT-65. BOBTERM has routines in it to handle the ATARI 850 INTERFACE automatically; I never really had to worry about "R:" handlers and DOS types when using BOBTERM with my ATARI 850 INTERFACE.

o A couple of trivial -- but important -- points:

1.) Hardware must be turned on in the correct order, with the ATARI 850 INTERFACE being turned on, the disk drives being turned on, the monitor being turned on, then the ATARI CPU being turned on, and any optional printer being turned on. If the ATARI CPU is turned on before the ATARI 850 INTERFACE is turned on, the ATARI will not find the "R:" device. This used to confuse me no end when I first owned the ATARI 850. Even now I will some times sit down and turn on my ATARI CPU and load KERMIT-65 without having turned on my ATARI 850 INTERFACE first. (Such an event is usually followed by the exclamation of an expletive....)

2.) Any full duplex modem device should be connected to comm. port "R1:", as port one is the de facto hardware supported "CONCURRENT I/O" bi-directional I/O mode (whereas PORT "R4:" is wired to support serial output in only a single direction at a time).

...I'm sure that you probably know all of this already, and it probably has nothing to do with your problem, but it never hurts to go over the basic points of hardware use now and again. I hope that something I said might be of service to you.

|> The 'PackBits' compression algorithm (used in the TIFF file format) is
|> simple and fast. The first byte (I may get this reversed) if between
|> 1 and 127 is the number of data bytes following; if between -1 and

Clay Halliwell's CVSquash is very similar to PackBits, where the pixel is defined in r,g,b and repetitions are coded with their run length. Also note that the Koala/TouchTablet/MicroIllustrator format is very similar to PackBits.

|> Another scheme is your standard LZH algorithm, but it's not
|> recommended for small memory machines because the table sizes are
|> large. I have used 4K table size on the Atari (ie a 12-bit symbol)

LZH is what's used in ARC and GIF to really compress down. See Jeff (Alf) Williams' AlfCrunch for source code, which my GIFNCODE is based upon.

|> I had a brainstorm for a graphics compression scheme. The scheme
|> would be for the reader to assume a scan line is identical to the

What you've suggested is similar to the 2-D encoding used in fax machines, referred to as modified READ for Group III faxes.

|> If you're heavy duty into it I suggest looking into JPEG, which is
|> claimed to be very good; I have no idea what they do, or the amount of

JPEG involves a bunch of multiplies per pixel, and as thus is probably not a good thing to try for the old 8-bit. I've looked at it :^)

1570. Atari 800XL help needed...

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-18 21:53:19 UTC
From: ccreado@ar.cs.wm.edu
Message-ID: <1993May18.215319.20012@cs.wm.edu>
Source record: 106928

A friend of mine has an Atari 800XL. Now, in the process of moving to an Asian country, he managed to completely mangle the disk(s) on which the operating system and the BASIC interpreter (I think) were provided. As far as I know, he has a 5 1/4" floppy drive, and since he bought this system many years ago, I assume that the drive uses low density (360K) diskettes. However, as I myself have never used an Atari, I am at a loss to try and find a replacement for his disks, which he cannot find now that he has moved. What I need is to know:

a) What sort of disks does one of these machines use, and
b) How do I get a replacement operating system/BASIC interpreter
disk for the computer?

Is there some way I can download or ftp the software from the net, or can I order the diskettes from somewhere? All the information that I have posted here is all the information I have. I hope that this is good enough for someone out there to help me.

Thanks, in advance, for your help.

There is a new & interesting board coming out for the (gasp!)
Amiga. I recently have become involved with these machines in my
work, and have been impressed, when comparing them to Macs & PC's
on Windows...

Anyways, there is a new board called the Emplant, which is designed
to run Mac ROMS on your amiga-> ie give you a Mac. The designers say it
will also run Mega St & 8-bit atari (and C64) given the Roms can be
obtained. THis sounds like a nice system--- you use the Amigas
display and Hard drive.... sounds very interesting....

>JPEG involves a bunch of multiplies per pixel, and as thus is probably
>not a good thing to try for the old 8-bit. I've looked at it :^)

Hi Jeff, good to see you again...

I just want to say that I think Jeff understates the complexity of JPEG. I recently looked it over, too, and let's just say that my first look nearly made my eyes pop out of my head: Fourier-like transforms from the spatial domain into the frequency domain, then filtering out of DC image components, and then data compression, just on the ENcoder side, and then the DEcoder has to reverse THAT. And this doesn't address the FILE format at ALL -- just that of the data once you've dealt with any "header" etc. that might be necessary (which it would) for recording the image height, width, depth (# of bitplanes, or bits-per-pixel), etc. etc...

At the very least, a JPEG encoder/decoder on the Atari would be very slow; you'd probably have to do a lot of FP (floating-point) math, although some of you more ingenious hackers might know ways to get there with integer math (which is faster)... If you were willing to put up with these constraints, though, there is of course no THEORETICAL reason why an Atari couldn't churn through the necessary calculations in time, in time...

Of more concern to ME is the fact that JPEG employs not only DATA compression, where "what you put in is what you get out, EXACTLY, byte-for-byte," but IMAGE compression, where image components too small (or "at too high a spatial frequency") for the human eye to respond to, are PERMANENTLY REMOVED from the encoded image. JPEG allows you to specify the threshold size for details to be retained/discarded, but even if you tell it to "not throw ANYTHING away," the limitations of digital implementation of the spatial-to-frequency-domain transformation unavoidably lead to you NEVER getting OUT of the DEcoder, exactly the same pixel stream you fed into the ENcoder. Call me a purist, a fussbudget, or worse, but THAT BUGS ME. I want my pixels, and I want 'em ALL!

Sorry, Jeff, if this covers stuff you deliberately didn't mention before; I thought if people understood some of the complexities involved maybe they'd go a little easier on you when you don't turn up tomorrow with a JPEG reader

Craig,

There is available for download (actually, FTP) from the Atari Archive MYDOS 4.5, but you won't be able to get it working if the person has no DOS at all. It's a Chicken and egg problem. You need a term program on the 8 bit, and perhaps something like DISK Communicator to create the MYDOS boot disk from the online file, but you can't run the term program of Disk Communicator without first booting DOS! You're gonna have to start with a premade DOS Boot DISK from somewhere, a friend, a public domain software dealer, someone like that.

Your BASIC Interpreter problem is an easier one to solve because there isn't a problem. On the 800XL, the BASIC interpreter is stored in an 8K ROM inside the machine. It's always accessible by doing a "RUN CARTRIDGE" command from DOS, as long as you didn't hold the OPTION key down when you turned the computer on. If you unplug the floppy drive from the computer and turn it on, BASIC should come up, with the familiar READY prompt. If for some reason it doesn't, your problems are much deeper rooted.

Jeff

I haven't fiddled around with the RF cable on my XL, but after my
original XL power supply died (the small, black one), I checked out the
box on the power cable. It seemed to be some type of shielding, the cable
was wrapped around a small magnet I believe.

1578. Digi-Studio info with new prices

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-19 10:31:43 UTC
From: djg0@aber.ac.uk
Message-ID: <1993May19.103143.6964@aber.ac.uk>
Source record: 106942

```
Digi-Studio Information
-----------------------

Digi-Studio is a set of programs for the 8-bit Atari (XL/XE) for creating
music using "real" sounds, which have been digitized. The Digi-Studio package
contains everything you will need to create and play music using digitized
sounds. Here's a list of the programs included:

* Keyboard Player. Allows you to play music live by using the computer's
keyboard like a piano keyboard. The sounds produced are, of course,
digitized. This program has fully responsive keys, so that sounds only
play for as long as you hold the key down.

* Tune Player. This program plays Digi-Studio tune files using digitized
sounds.

* Sample Editor. This program allows you to edit sound samples by using
a joystick. It also has "cut and paste" facilities, so you can also create
your own samples.

* Tune Compiler. This program allows you to play Digi-Studio tune files
in your own Basic or Turbo-Basic programs.

* LIDS Compiler. This program allows you to create your own Digi-Studio
tune files by use of a language called LIDS.

Also included are 55 sound samples, and 47 ready-to-play Digi-Studio
tune files.

The Digi-Studio system comes on 2 DS/SD disks. Disk one contains the main
programs and a starter pack of sounds and tunes. Disk two contains more
samples and sounds for use with Digi-Studio.

The Digi-Studio system is also supplied with a 44 page manual in A4 size(UK),
and standard letter size in the US. This manual has sections describing all the
programs listed, but also has a lengthy section on how to read music. An
appendix has also been added containing music along with the corresponding LIDS
programs.

The Digi-Studio system (with manual and 2 disks) costs just 7pounds, including
P&P. In the US it costs $15, including shipping.

Fill in the form below and send it with payment today!

------CUT------
Please send me a copy of the Digi-Studio system, with manual and 2 disks.
I enclose payment for UK[ ]. I enclose payment for US[ ]. (Tick box).

Mike,

Woa there. You talk of transferring software from your Amiga to your Atari. You're not talking of transferring Amiga software to your Atari are you?

Jeff McWilliams

Oh no. I used my Amiga to download the whole atari ftp archive site at 14.4k and have it stored on the Amiga so I'm slowly transfering files from there to the Atari to check them out.

Unfortunately when I got my system about a week ago it didn't come with a terminal program only the telelink I cart, we all know how useless that is... So I typed in the AMODEM42.BAS file and transfered VTERM over to the Atari and started using that...

I've finally figured out why BobTerm didn't work, it didn't like my DOSXL so I'm now running it with MyDos4.50

In fact a friend of mine and I are planned to write an Atari Emulator for the Amiga...

BTW does anyone know if there is already an Atari Emulator for the Amiga??

Message-ID: <1993May19.180745.19908@ge-dab.GE.COM>
Source record: 106938

Chris,

Yes, JPEG is every bit as complex as that...I was grossly simplifying.
Some of the JPEG decoding (like cosine calculation) would of course be
done by table lookups where possible. Since the DC-level values for
each 8x8 pixel group are more easily decoded, an 8:1 reduction mode
could be had at much less effort (or so I imagine).

And yes, the image compression allows the high-frequency detail (as
much as the encoder wishes) to be removed. May be somewhat annoying
to the purist, but the average Joe looking at pictures on his PC
probably doesn't care about that - especially if he was happy with
the 256-color VGA modes anyway.

Message-ID: <01GYD57SJ7IW8Y7M9Y@delphi.com>
Source record: 106941

The 1200XL never had internal drives.
You are thinking either about Jeff McWilliams hacks, or te 1450XLD.
Either way the odds of you finding such a system are nil.

However, since you have heard of people with them, these types of units are more common than they used to be
as the 8-bit userbase disintegrates and prototype machines lose their luster among those aching for higher platforms,
me not included.

I have a 1400XL-- Not working-- But it may return to life some day...

1596. Re: Atari 800XL help needed...

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-20 19:22:50 UTC
From: phbill@cyberden.sf.ca.us
Message-ID: <R15u4B2w165w@cyberden.sf.ca.us>
Source record: 106950

<cough> Atari disks are 88k, 127k and 180k <cough>... in MOST cases. The Atari 810 drive uses the 88k, unless it's been upgraded (!? is there an upgrade? I dunno much of 810's). The Atari 1050's (pretty common, esp. in Europe, it seems) do 127k (note, these #s are PER SIDE, not per DISK.. most drives read one side at a time). The 1050's can be upgraded to do 180k which is the lowest of low on IBM 5.25" drives (nowadays at least). Also, some 3rd party drives do 180k, as well as the Atari XF551 .. except I THINK this is the one that does double sided reading?

Im sure someone else'll give a bit more detailed explanation soon ;)

Re:DOS and BASIC. What BASIC did he have? MOST people have BASIC on cartridge or internal (ie, turn on the computer w/o booting some game or something, and having no cart.s in would have the system end up in BASIC. The only Atari's that didn't have BASIC internal were the 400/800/1200xl and the 1400/1450xl's (?) The rest: 600xl / 800xl / XE series, all had internal BASIC, unless it's been upgraded)

The BASIC most of us have on disk is "TurboBASIC XL" or "FrOst" BASIC. The XL version works on ONLY the XL/XE series. FrOst works on all Ataris.. Supposedly they are identical, except the fact that the XL version supports XL/XE's "extra" 16K of RAM (under the Operating System).

These BASIC's were written by Frank Ostrowski (sp?), hence the name FrOst.

As for DOSes, Atari DOSes are all PD now. SpartaDOS is still copyrighted. SpartaDOS X is pretty much identical to SpartaDOS, except it's on cartridge (and requires XL/XE??????), and YES folks, I know there are other differences! :)
MyDOS is about the only other "biggy" DOS around. Unlike Atari DOS (2.x and even DOS XE???), both MyDOS and SpartaDOS support subdirectories, just like MSDOS. ie, when looking at a directory listing (list of files on the drive), it goes something like
BOB DAT
ZAPPER BAS
xxx free ...
on non-sub-directory supporting DOSes... with directory DOSes, it could go:

directory of D1: (drive 1)
BOB DAT
GAMES <dir>
GEORGE DAT
xxx free ...

and

directory of D1:GAMES: (drive 1, inside the GAMES directory)
ZAPPER BAS
KILLER BAS
xxx free ...

so you can organize your files more neatly (eps. if you have a hard drive!)

MyDOS is public domain and is still being supported (as if SpartaDOS isnt.... who has the rights to Sparta tho????!)

On another note, the other biggies for the Ataris are:

BobTerm and Express! - the two most well known and most used terminal programs

well... that's about all I can say.

dont mine me folks, im home sick from school ;)

Victor,

The 800XL monitor jack is fully compatible with your VCR video and audio inputs. In fact, I've used the VCR instead of an RF box on several occasions here. Heck, I don't even own an RF box anymore!
The output from the computer you usually use is Composite video, Luma and Chroma might be on some really really expensive VCRs that output to high resolution viewing monitors.

The original Atari 8k boards were almost identical to the 16k boards and used
16k chips. They were designed to prevent access to half their addresses.
The conversion process from 8k to 16k is simple. If you're board has been
modified you should find a few jumpers (can't remember how many, but not many),
and possibly place where a resistor used to be and a trace or two scratched
out near the connector.

Mike,

RT8 is the R-Time 8 cartridge that used to be sold by ICD, Inc.
It was a real time clock/date keeper for us 8 bitters, who don't have
internal no slot clock/date chips. Highly useful in conjunction with
SpartaDOS because like MS-DOS on the PC clones, SpartaDOS supports
time/date stamping of files.

Mike,

Oh, okay, sounds like you're doing things the smart way transferring files the way you are. I haven't heard of an 8 bit emulator for the Amiga, but frankly it seems fitting that there should be one. I mean, the Amiga holds a closer architectural resemblance to the 8 bit than the Atari ST does, and if I remember correctly, at least a good handful of 8 bitters moved to the Amiga platform.

Jeff

1602. New Address for Tiger Developments

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-21 17:14:31 UTC
From: rje@cs.nott.ac.uk
Message-ID: <1993May21.171431.14286@cs.nott.ac.uk>
Source record: 106812

Just as the title says, Tiger Developments now has a new address which is:

Tiger Developments
159 Warley Road
Halifax
West Yorkshire
HX1 3TW
England

telephone: 0422 351845

Have you heard of Tiger Developments before???

Well, they are a company over here in the UK which still write and release
new titles for the 8-bits.
Brilliant games! (O.K. I admit it, I am biased) :-) :-) :-)

Any letters etc., sent to their old address will still get passed on.

>850 INTERFACE is turned on, the ATARI will not find the "R:" device. This

It doesnt matter at all which device (disk drives etc) you turn on first
as long a the interface is ON when the handler is called.

I have the original tech manual for the 850 interface and found it to be
the worst most hastily written document Atari has ever put out, you
really have to read it 50 or 60 times till you get any information out of it.

> At the very least, a JPEG encoder/decoder on the Atari would be very slow;
> you'd probably have to do a lot of FP (floating-point) math, ...

Nope. No production JPEG codec that I know of uses any FP math at all.
All those expensive-looking cosines are applied to constants, if you look
closely; and scaling the calculations to use integer math instead of
floating is absolutely standard.

Now, that does still leave you with a lot of integer multiplies, so it's not
going to be *speedy* on an 8-bit chip, but it's not out of the question if
you're patient.

> Of more concern to ME is the fact that JPEG employs not only DATA compres-
> sion, where "what you put in is what you get out, EXACTLY, byte-for-byte,"
> but IMAGE compression, where image components too small (or "at too high a
> spatial frequency") for the human eye to respond to, are PERMANENTLY REMOVED
> from the encoded image.

This is the usual reactionary argument against lossy compression. What you
fail to take into account is that there are losses everywhere in a digital
imaging system. Unless you own, say, a 2000x2000x24bit true-color display
(if you did, you wouldn't be driving it with an 8-bit CPU :-)) the
compromises made in order to present a photographic image on your display
will vastly outweigh any data loss from JPEG, at least at reasonable
compression settings.

For more info see the JPEG FAQ, posted regularly in comp.graphics.

There are two possibilities here:
1- There is a break in the circuit
2- You have a bad keyboard decoder chip

1- Pick up a bottle of conductive paint from your local automotive supply shop. This stuff is used to repair the rear window electric defrosting grid. Scrape the grid lightly at each key, and paint in the grid.

If this doesn't work, check the circuit from the keyboard, through the keyboard to motherboard connector, and to the keyboard decoding chip (there are two chips on the motherboard). You may have to repair the circuit by running a new wire.

2- You can test the keyboard decoder chip by jumpering between pins on the chips. The keyboard is a matrix with a key at the intersection of two wires. By jumpering two pins from the keyboard decoder chips, you are bypassing the keyboard. It will take some time, but trace the lines from the keyboard to the chips and try jumpering the pins for the non-working keys.

BTW, with a little arithmetic, you will notice that the keyboard decoder chips can support more keys than appear on the keyboard. Atari's XL/XE OS supports the four 1200XL function keys on the entire XL/XE line. I installed four button switches in a diamond pattern on my 130XE for the 1200XL F1-F4 buttons. In non-shifted mode, these buttons will give you one key cursor control within most applications. The function keys provide a variety of other uses when used in combination with Shift and Control keys.

Mangling a floppy disk is harder than it might seem. Unless the disks have been physically damaged or erased theres a good chance there still usable. I once had a disk that wouldn't rotate in the its plastic cover so I removed it. I could actually put it into the drive and operate it without the cover. In your friends case it may be his only option. You can always scrap another disk to use as a cover temporarily if you're you don't like the idea of putting it into the drive without one.

I haven't tried this with a 3.5 inch diskette yet.

I've been using my Atari SX212 on my IBM for about a year and now I'm interested in hooking it up to my dusty old Atari XE. (I can't wait to have a look at the new Demos, and I thought Atari was dead!) I don't have any communications software for it so I'm in a catch-22 situation. How can I download the software without the software?
Anyways, I was just wondering if it was possible to type in something into Basic that would allow me to download a REAL program. If someone could post or e-mail me some help, I would apreciate it very much.

Thanks in advance,
Nate.

You might have to see if BEST can send you a new keyboard MYLAR,
I don't know if they go that route, or if you have to but a totally
new keyboard. It's the same keyboard as in the 800XL.

> the RF modulator?

Yep... if your VCR simply has an "audio in" and a "video in" set of RCA style ports... or if you have, say, an old AMDEK or Commodore color Monitor (which have these ports too) (except the one AMDEK I've used has a microphone style audio input, but I have a handfull of RCA=>audio adapters, so it was no problemt).

anyways... you'll need to get or make a DIN -> 2-RCA cable... like the old Commodore Monitor cables, which are probably still around all over the place (hey, >I< got one!) :) ... check the Atari 8bit FAQ posted a little while back or one of the good hardware books on Atari 8bits if you want to make your own. My dad (and I) made a DIN -> audio port LONG long ago... I saw a hack for one in an ANTIC or something and decided I wanted it... they unfortunately didn't explain which pins were for video and the such.. so I have a pretty useless DIN -> audio cable lying around

;)

happy hunting...

good to see someone on here who ISNT from the US/Canada/Europe :)

1617. PLUS 256k for the Atari 800! / 6502 Instruction list WANTED!

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-22 23:31:13 UTC
From: mat@unh.edu
Message-ID: <MAT.93May22233113@metro.unh.edu>
Source record: 106831

Has anyone done the modifications found in the addmema.arc file
from the Atari archives??

I purchased the parts on Thursday and did the "hack" yesterday night.
Now I have 288k of which only 48k I can use. I haven't done the AXLON
mod because I'm not sure what the differences or drawbacks might be from
the PLUS256k mod..

Does anyone know the specifics to the AXLON mod? Does it allow 256k or
only 128? What address does it use for page switching? Does it use
this same address to store what the current page is?

So far I've determined that 55040 is the page select address and
that the current page selected cannot be determined (It must be
remembered)

The documentation isn't that good on explaining the how the patches
supplied for mydos 3.015 or dos 2.5 work. Dos 2.5 isn't any good
to me because I have a DD drive and I only have mydos 4.50.

I'm currently looking over the MyDos code but I'm finding myself not
able to remember all the 6502 instructions. Does anyone have a file
explaining all the 6502 instructions?

Thanks, Mike

1618. 3.5 inch drives

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-22 23:42:34 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1993May22.234234.85431@austin.onu.edu>
Source record: 106828

Here is an idea I had and I would like some advice. Has anyone ever
connected an IBM compat (not true IBM) to an 8bit? I mean an internal,
not an external drive. Questions: Can any Dos support floppies of 1.44 Meg?
Are there any technical aspects that I need to research/avoid to get
this to work. I have mistakenly posted this article to *.atari.ST so
to find a more in-depth description, please read my article of the same
name there. Any support/advice would be appreciated.

Thanks in advance.

Message-ID: <01GYHT1PJK5U91VWD3@delphi.com>
Source record: 106830

Issue 1: the 1400 series has internal Basic. I should know, I own one.

Issue 2: Bill has the 4.53 source that I have him, it would probably be easy for him to PUT it to the archives.
It would cost me money to do it via delphi.

(I have him=I gave him).

Issue 3: I managed to contact the author of a MYDOS CLI with UNIX-like commands. All interested parties can contact
him at slackey@bbn.com.

He is local to me and I will be discussing his project further in the coming days.

Bill, I advise you to begin corresponding with Stan Lackey and trade programming/MYDOS notes.

Issue 4: An AMIGA atari 8-bit emulator is a wonderful idea, and would take far less muscle to accomplish than an ST
IBM or MAC emulating the 8-bit.

I for one would value such a system and it would be a major factor in easing the pain of upgrading, since if I consider
ANY 16/32 bit machine it will be an AMIGA of one sort or another due to the reasons Jeff stated, its similarity in
archetecture to the Atari 8-bit.

One thing I that did not carry through, however, is some of the simplicity and flexibility of the ATARI I/O scheme,
however, which is unfortunate.

It doesn't to the best of my knowledge, use an IOCB with a byte (letter) assigned to every device and a logical device
number.

Aside from the graphics and sound chips the I/O scheme of the Atari 8-bit is one of the best parts about it, and why
it stands up so well against comparable 8-bits.

or 16 bits for that matter!

1621. Re: 3.5 inch drives

Lance,

The Floppy Board module for the Computer Software Systems
BLACK BOX does just that. It lets you attach 5.25" 360K and 1.2meg
and 3.5" 720K and 1.44 meg floppy drives to your atari 8 bit.
SpartaDOS and MyDOS 4.5 both are able to use the disks to their
full potential. Since the Atari <-> drive connection is done through
the parallel bus instead of through the standard SIO port connector,
data transfer rates are much faster than what can be attained through
a standard Atari 8 bit type drive. Additionally, floppy board drives
have the capability to read and write to IBM and Atari ST formatted disks.
Although you obviously can't run ST or IBM software, you can certainly
exchance word processor text files and goodies like that.

1622. A Peek At The Upcoming June AC

Newsgroup: comp.sys.atari.8bit
Date: 1993-05-23 17:39:23 UTC
From: poehland%phvax.dnet@smithkline.com
Message-ID: <9305231730.AA04075@smithkline.com>
Source record: 106833

Greetings, AC Subscribers!

The June 1993 issue of ATARI CLASSICS is now at the printer and will probably hit your mailbox about the middle of the month. Our June Software Disk is also on schedule and will probably appear in late May or early June.
